Chemical Properties A white, hygroscopic, crystalline powder. Mp about 156° to 163°; anhydrous form Mp about 190°. Soluble 1 in 1 of water and 1 in 350 of ethanol; practically insoluble in chloroform and ether; soluble in methanol. Log *P* (octanol/water), -7.94.

Suxamethonium Bromide

$C_{14}H_{30}Br_2N_2O_4 \cdot 2H_2O$ = 486.2

CAS—55-94-7

Synonyms Choline bromide succinate; succinylcholine bromide.

Proprietary Name *Brevidil M*

Chemical Properties A white or creamy-white powder. Mp about 225°. Soluble 1 in 0.3 of water and 1 in 5 of ethanol; practically insoluble in chloroform and ether.

Suxamethonium Iodide

$C_{14}H_{30}I_2N_2O_4$ = 544.2

CAS—541-19-5

Synonyms Dithylinum; succinylcholine iodide.

Proprietary Name *Célocurine*

Chemical Properties A white, slightly hygroscopic, crystalline powder. Mp about 243° to 245°. Freely soluble in water; very slightly soluble in ethanol; practically insoluble in ether.

Thin-layer Chromatography System TA— R_f 0.01; system TB— R_f 0.00; system TC— R_f 0.00; system TE— R_f 0.00; system TL— R_f 0.00; system TN— R_f 0.35; system TO— R_f 0.10; system TAE— R_f 0.00; system TAF— R_f 0.00 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—not eluted.

Ultraviolet Spectrum No significant absorption, 230–360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1724, 1148, 1308, 961, 952, 1612 cm^{-1} (KBr disk).

Quantification

Plasma MS [Roy *et al.* 2001].

HPLC Electrochemical detection. Limit of detection, 156 nmol [Pitts *et al.* 2000]. Electrochemical detection. Limit of detection, 250 $\mu g/L$ [Gao *et al.* 1998]. Fluorescence detection. Limit of detection, 100 $\mu g/L$ [Lagerwerf *et al.* 1991].

Disposition in the Body Suxamethonium chloride is slowly and incompletely absorbed after oral administration; it is absorbed after IM administration but generally given by the IV route. It is rapidly distributed into the extracellular fluids throughout the body. Suxamethonium is rapidly hydrolysed in plasma and body tissues to succinylmonocholine (weak activity) and choline. Succinylmonocholine is then slowly hydrolysed to succinic acid and choline. <3% of a dose is excreted unchanged in the urine.

Toxicity

A 33-year-old anaesthesiologist, who committed suicide by injecting suxamethonium and thiobarbital, had a postmortem blood suxamethonium concentration of 14.3 mg/L 3 h after administration [Somogyi *et al.* 1989].

Half-life Plasma half-life, \approx 3 min.

Dose Usually 20 to 100 mg of suxamethonium chloride, IV.

Suxethonium Bromide**Muscle Relaxant**

$C_{16}H_{34}Br_2N_2O_4 = 478.3$

CAS—111-00-2

IUPAC Name Ethyl-[2-[4-[2-[ethyl(dimethyl)azaninium]ethoxy]-4-oxobutanoyl]oxyethyl]-dimethylazanium dibromide

Synonym 2,2'-Succinyl-dioxybis(diethyl-dimethylammonium) dibromide

Proprietary Name *Brevidil E*

Chemical Properties A slightly hygroscopic, white or slightly cream, crystalline powder. Mp 158°. Readily soluble in water, yielding weakly acidic solutions. Log *P* (octanol/water) -7.0.

Thin-layer Chromatography System TA—*R_f* 0.01; system TN—*R_f* 0.40; system TO—*R_f* 0.23 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1740, 1163, 1638, 1270, 962, 1012 cm^{-1} (KBr disk).

Disposition in the Body After IV administration it is rapidly hydrolysed in plasma and body tissues to succinic acid and choline.

Dose 1.5 to 1.9 mg/kg IV.

Syrosingopine**Antihypertensive**

$C_{35}H_{42}N_2O_{11} = 666.7$

CAS—84-36-6

Synonyms 18-[[4-[(Ethoxycarbonyloxy)-3,5-dimethoxybenzoyl]oxy]-11,17-dimethoxyhimbans-16-carboxylic acid methyl ester; methyl carbethoxysyrosingoyl reserpate.

Proprietary Names *Isotense; Londomin; Raunova; Serinamin; Singoserp; Siringina.*

Chemical Properties A white or slightly yellowish crystalline powder. Mp 175° to 179°. Practically insoluble in water; freely soluble in chloroform and acetic acid; slightly soluble in ether.

Colour Tests Mandelin's test—green-brown; Marquis test—brown.

Thin-layer Chromatography System TA—*R_f* 0.78 (acidified potassium permanganate solution, positive).

Ultraviolet Spectrum Ethanol—258 ($A_1^1=242a$), 298 nm.

Infrared Spectrum Principal peaks at wavenumbers 1209, 1130, 1247, 1180, 1770, 1727 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 181, 395, 198, 251, 397, 396, 199, 666.

Dose 0.5 to 3 mg daily.

T-2 Toxin

Trichothecene Mycotoxin

$C_{24}H_{34}O_9 = 466.5$

CAS—21259-20-1

IUPAC Name (2 α ,3 α ,4 β ,8 α)-4,15-Bis(acetyloxy)-3-hydroxy-12,13-epoxytrichothec-9-en-8-yl 3-methylbutanoate

Synonyms 4 β ,15-Diacetoxy-3 α -hydroxy-8 α -[3-methylbutyloxy]-12,13-epoxytrichothec-9-ene, fusariotoxin T 2; insariotoxin; mycotoxin T 2.

Chemical Properties Type-A trichothecene mycotoxin, associated primarily with *Fusarium sporotrichioides*. Surveys have shown that T-2 occurs in cereals at relatively low levels although it is one of the most potent of the naturally occurring trichothecenes affecting animals as a food and feed contaminant [WHO/JECFA 2002]. Crystals, Mp 151° to 152° [O'Neil 2006], 146° to 149° [Sydenham *et al.* 1996]. Freely soluble in ethyl alcohol, ethyl acetate, chloroform, DMSO and other organic solvents; slightly soluble in petroleum ether; very slightly soluble in water [O'Neil 2006]. Log *P* (octanol/water), 2.27 [Meylan, Howard 1995]. For a study of the stability of trichothecenes in calibrant samples see Widestrand, Pettersson [2001].

Thin-layer Chromatography Plates: RP-18 and KC-18. Solvent systems: A) methanol: water; B) acetonitrile: water; C) tetrahydrofuran: water. Location reagent: 4-(*p*-nitrobenzyl)pyridine for trichothecenes; UV ($\lambda = 365$ nm) for aflatoxins, ochratoxin A, citrinin; aluminium trichloride for sterigmatocystin; Azoene Fast Violet B for zearalenone; 3-methyl-2-benzthiazolinone hydrazone hydrochloride for patulin and penicillic acid. Solvent composition and R_f values reported as shown in the table below.

Mass Spectrum Principal ions at m/z 121, 180, 364, 278, 205, 382, 305, 261 [Sydenham *et al.* 1996].

Quantification

Blood GC-MS Column: BP-5 (12 m \times 0.22 mm i.d., 0.25 μ m). Carrier gas: He, 8 psi. Temperature programme: 90° for 2 min to 180° at 20°/min to 240° at 5°/min for 2 min. CI, negative ion mode, SIM acquisition mode. Limit of detection, 2–7 ppb for DON, NIV, T-2, HT-2, T-2 tetraol, diacetoxyscirpenol, scirpentriol, 15-

[Abramson *et al.* 1989]

High Performance Liquid Chromatography Column: C₁₈ (25 cm \times 4.6 mm i.d., 10 μ m). Mobile phase: acetonitrile: water (70:30), flow rate 3 mL/min. UV detection ($\lambda = 278$ nm). Retention time 9.6 min. Limit of detection, 30 ng [Yagen *et al.* 1986].

Ultraviolet Spectrum No UV absorption [Sydenham *et al.* 1996], Cyclohexane—187 nm [Rajakylä *et al.* 1987].

MAS (heptafluorobutyrylimidazole derivatives) [Black *et al.* 1986]. Column: Varian 3700 J & W DB-5 (15 m \times 0.32 mm i.d., 0.25 μ m). Carrier gas: He, 35 cm/s. Temperature programme: 50° for 2 min to 300° at 10°/min for 8 min. CI, SIM acquisition mode. Limit of detection, 0.7 ng/g [D'Agostino *et al.* 1986].

Urine GC-MS Column: BP-1 methylsilicone (25 m \times 0.2 mm i.d., 0.25 μ m). Carrier gas: He, 15 psi. Temperature programme: 160° for 1 min to 275° at 10°/min,

for 5 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Limit of detection, 2–7 ppb for DON, NIV, T-2, HT-2, T-2 tetraol, diacetoxyscirpenol, scirpentriol, 15-MAS (heptafluorobutyrylimidazole derivatives) [Black *et al.* 1986].

Other GC In-vitro Bovine Ruminal Fluid. Column: DB1701 capillary (30 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 250° to 275° at 5°/min for 5 min for TMS or 225° to 275° at 5°/min for 5 min for TFA. Retention time: 8.26 min [Swanson *et al.* 1987]. Grain Samples. Column: SE-30 fused silica (25 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 35 cm/s. Temperature programme: 180° to 220° at 4°/min to 250° at 15°/min for 5 min. Retention time: 15.1 min. Limit of detection, 25 μg/L [Sydenham, Thiel 1987]. Pig Plasma and Urine. Column: glass packed with 3% OV-17 on 100–120 mesh Supelcoport (1.8 m × 2.0 mm i.d.). Carrier gas: He, 35 mL/min. Temperature: 165°. ECD (Ni⁶³). Retention times: DON 6 min, T-2 tetraol 5 min, scirpentriol 4.5 min (trifluoroacetic acid derivatives). Limit of detection <25 ppb [Rood, Jr. *et al.* 1986]. Cereal Samples. Column: SE-52 (12 m × 0.25 mm i.d.). Carrier gas: H₂, 40 kPa. Temperature programme: 180° to 260° at 4°/min. FID. Limit of detection, 100 ppb [Bata *et al.* 1983].

GC-MS Wheat Samples. Column: HP-5 capillary (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: N₂, 1 mL/min. Temperature programme: 80° for 1 min to 160° at 30°/min to 183° at 1°/min to 280° at 12°/min for 5 min. ECD. Limit of quantification, 20 μg/kg, limit of detection, 10 μg/kg [González *et al.* 2008]. Soy Sauce Samples. Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 140° for 2 min to 275° at 7°/min for 2 min to 290° at 30°/min for 5 min. Limit of detection, 4 μg/kg for T-2, 7 μg/kg for T-2 tetraol and 5 μg/kg for T-2 triol [Schollenberger *et al.* 2007]. Food Samples. Column: Rtx-200 (60 m × 0.25 mm i.d., 0.1 μm). Carrier gas: He, 1.3 mL/min. Temperature programme: 115° for 5 min to 125° at 50°/min to 300° at 5°/min for 10 min. EI ionisation at 70 eV, positive ion mode. Retention time: 24.6 min for DON, 28.8 min for 3-acetyl-DON, 28.3 min for 15-acetyl-DON, 26.9 min for NIV, 26.4 min for fusarenone-X, 29.4 min for diacetoxyscirpenol, 30.1 min for neosolaniol, 33.7 min for HT-2, 34.5 min for T-2. Limit of quantification, 0.30 μg/kg for DON, 0.26 μg/kg for 3-acetyl-DON, 0.19 μg/kg for 15-acetyl-DON, 0.28 μg/kg for NIV, 0.16 μg/kg for fusarenone-X, 0.36 μg/kg for diacetoxyscirpenol, 0.37 μg/kg for neosolaniol, 0.26 μg/kg for HT-2, 0.18 μg/kg for T-2, limit of detection, 0.16 μg/kg [Schothorst *et al.* 2005]. Grain Samples. Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 80° to 245° at 60°/min for 3 min to 260° at 3°/min to 270° at 10°/min for 7 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Limit of quantification, 30 μg/kg for DON, 3-acetyl-DON, fusarenone-X, and diacetoxyscirpenol, 20 μg/kg for HT-2 and T-2, 30 μg/kg for nivaleanol (N,O-bis(trimethylsilyl)acetamide; trimethylchlorosilane: N-trimethylsilylimidazole derivatives) [Jestoi *et al.* 2004]. *In vitro* Bacterial Suspensions. Column: DB-5 (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 0.6 mL/min. Temperature programme: 80° to 245° at 60°/min for 3 min to 260° at 4°/min to 270° at 10°/min for 7 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection not reported [El Nezami *et al.* 2002]. Fungal Extracts. Column: HP-5 (30 m × 0.25 mm i.d., 0.1 μm). Carrier gas: He, 40 cm/s. Temperature programme: 80° for 1 min to 160° at 40°/min to 205° at 4°/min to 240° at 8°/min to 300° at 40°/min for 3 min. EI ionisation, positive ion mode, CID or NICI mode. Limit of detection, 30–70 pg or 50–120 pg (NICI) [Nielsen, Thrane 2001]. Barley Samples. Column: Rtx-200 (30 m × 0.25 μm i.d., 0.25 μm). Carrier gas: He, 0.75 mL/min. Temperature programme: 90° for 0.2 min to 210° at 30°/min to 300° at 6°/min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Retention time: 12.3 min for DON, 13.8 min for 3-acetyl-DON, 14.8 min for fusarenone-X, 14.0 min for diacetoxyscirpenol, 13.8 min for 15-MAS, 17.9 min for T-2, 12.9 min for scirpentriol, 17.6 min for zearalenone. Limit of detection, 0.1–0.5 mg/kg [Onji *et al.* 1998]. Spiked Barley. Column: HP-5 5% phenylmethylsilicone capillary (25 m × 0.2 mm i.d., 0.3 μm). Carrier gas: He, 1.5 mL/min. Temperature programme: 333 K for 1 min to 473 K at 20 K/min to 553 K at 10 K/min for 10 min. EI ionisation at 70 eV. Limit of detection, 30 pg [Kostiainen, Nokelainen 1990]. 'Yellow Rain' Powder Sample. Column: glass packed with 3% OV-17 on 100/120 mesh Chromosorb (1.0 m × 2.0 mm i.d.). Carrier gas: He, 25 mL/min. Temperature programme: 180° to 260° at 12°/min for 5 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Retention time: 2.3 min for DON, 6.2 min for T-2, 5.5 min for HT-2, 6.5 min for zearalenone, 4.0 min for diacetoxyscirpenol (trimethylsilyl derivatives). Limit of quantification not reported [Rosen, Rosen 1982].

HPLC Grain Samples. Column: C₁₈ (250 × 4.0 mm i.d., 5 μm). Mobile phase: acetonitrile: water (65:35) containing 0.75% acetic acid, flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex}=292$ nm, $\lambda_{em}=425$ nm). Limit of detection, 0.4 μg/kg for DON and HT-2, 0.2 μg/kg for nivaleanol and diacetoxyscirpenol, 1.0 μg/kg for 15-acetyl-DON and 3-acetyl-DON, 0.6 μg/kg for fusarenone-X and T-2 (coumarin-3-carbonyl derivatives) [Dall'Asta *et al.* 2004; Mateo *et al.* 2001]. Column: LiChrospher 100 C₁₈ (250 × 4.0 mm i.d., 5 μm). Mobile phase: acetonitrile: water (65:35) containing 0.75% acetic acid, flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex}=292$ nm, $\lambda_{em}=425$ nm). Retention time: ≈8.5 min [Jimenez *et al.* 2000].

LC-MS Fungal Cultures. Column: C₁₈ (150 × 3.0 mm i.d., 3.5 μm). Mobile phase: water: methanol both containing 10 mmol/L ammonium acetate and 20 μmol/L sodium acetate (70:30 to 50:50 over 1 min to 40:60 over 9.5 min to 15:85 over 1 min for 7 min), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 5.6 min for DON, 3.9 min for NIV, 7.0 min for de-epoxy-DON, 7.7 min for verrucarol, 6.7 min for neosolaniol, 9.4 min for aflatoxin G₂, 11.4 min for aflatoxin B₂, 10.5 min for aflatoxin G₁, 12.5 min for aflatoxin B₁, 12.7 min for diacetoxyscirpenol, 16.8 min for ochratoxin A, 17.6 min for T-2 toxin, 17.5 min for verrucarol A, 17.7 min for roridin A, 18.9 min for zearalenone,

19.5 min for sterigmatocystin. Limit of detection, 1.5 μg/L [Delmulle *et al.* 2006]. Corn, Wheat, Cornflakes and Biscuits. Column: Zorbax Eclipse XDB C₁₈ (150 × 2.1 mm i.d., 3.5 μm). Mobile phase: 10 mmol/L ammonium acetate: methanol (90:10 to 0:100 in 40 min), flow rate 200 μL/min. APCI. Limit of detection, 0.2 ng/g [Tanaka *et al.* 2006]. Wheat Flour. Column: LC₁₈ Supelcosil (250 × 4.6 mm, 5 μm). Mobile phase: water: methanol (80:20 to 35:65 in 9 min for 8 min to 10:90 for 5 min to 80:20 for 7 min), flow rate 1.0 mL/min. ESI, positive ion mode. Limit of quantification, 5 ng/g [Biancardi *et al.* 2005]. Column: SB-RP18-Zorbax (150 × 3.0 mm i.d., 3.5 μm). Mobile phase: methanol: water (30:70 to 100:0 in 8 min), flow rate 250 μL/min. ESI, negative and positive ion mode, MRM acquisition mode. Retention time: 13.6 min. Limit of quantification, 10 ppb, limit of detection, 0.2 μg/kg [Biselli, Hummert 2005]. Spiked Oats. Column: ODS-2 C₁₈ (200 × 2.1 mm i.d., 5 μm). Mobile phase: 1 mmol/L ammonium acetate: acetonitrile (80:20 to 0:100 in 5 min for 3 min to 80:20 for 10 min), flow rate 0.3 mL/min. APCI positive ion mode, SIM acquisition mode. Limit of quantification, 50 ng/g [Razzazi-Fazeli *et al.* 2002]. Mouldy Interior Finishes. Column: Lichrocart 250-3 Purospher RP18. Mobile phase: methanol: 10 mmol/L ammonium acetate (20:80 for 4 min to 70:30 at 8 min for 11.5 min to 90:10 in 1 min for 15.5 min), flow rate 400 μL/min. ESI, positive ion mode. Retention time: 18.1 min. Limit of detection, 0.02 ng [Tuomi *et al.* 2000]. Wheat Samples. Column: C₁₈ (125 × 2.0 mm i.d., 3 μm). Mobile phase: methanol: water (25:75 to 2:98 over 12 min), flow rate 0.25 mL/min. APCI, positive ion mode, full-scan. Limit of quantification, 50 ppb for DON and neosolaniol, 100 ppb for NIV and 15-acetyl-DON, 40 ppb for fusarenone-X, 25 ppb for 3-acetyl-DON, 20 ppb for diacetoxyscirpenol, 10 ppb for HT-2, 60 ppb for T-2, limit of detection, 3 ppb [Berger *et al.* 1999]. Rat, Cow and Hen Urine and Faeces. Column: Zorbax ODS (25 cm × 4.6 mm i.d.). Mobile phase: methanol: 0.1 mol/L ammonium acetate (20:80 to 70:30 in 20 min for 5 min), flow rate 1.5 mL/min. TIS, CI, positive ion mode, full scan or MID mode. Limit of detection, 1 ng (full scan) and 50 pg (MID) [Voyksner *et al.* 1987].

Note For an LC-MS method for the quantification of multiple mycotoxins in a variety of nuts and dried fruits, see Spanjer *et al.* [2008]; in infant foods, see Lattanzio *et al.* [2008]. For the determination of 39 mycotoxins in wheat and maize by LC-MS, see Sulyok *et al.* [2006]; for Type-A and -B trichothecenes in cereals by LC-MS, see Klotzel *et al.* [2005]; for 17 mycotoxins using HPLC-DAD, see Kuronen [1989] and also Jimenez, Mateo [1997]. For a purity assessment study of mycotoxin standards comparing UV, HPLC-UV, GC-ECD, GC-FID, GC-MS, LC-MS, DSC, NMR and FT-IR methods, see Krška *et al.* [2005]. For an ELISA assay for T-2 toxin see Nikulin *et al.* [1996] or Stratton *et al.* [1993].

Disposition in the Body At the time of writing, there is no T-2 toxin toxicokinetic information available in humans. Animal studies have shown that the oral bioavailability of all trichothecenes is generally low as a result of physiological instability and first-pass metabolism. T-2 is rapidly absorbed after ingestion and it is distributed in the organism with little or no accumulation in any specific organs [Schlatter 2004]. Metabolism can result in glucuronide conjugates and complete or partial de-esterification may occur if ester functionalities are present. Mixed function oxidase activity is important in the metabolism of T-2 toxin to 3'-hydroxy T-2 toxin. The pattern of metabolism and excretion of T-2 toxin is very complex [Voyksner *et al.* 1987]. T-2 is rapidly metabolised to HT-2 *in vivo* [Schlatter 2004]. **Toxicity** LD₅₀ (oral) in chickens (mg/kg): 4.97 [Ueno 1983]; LD₅₀ (IP) in mice 9.1 mg/kg [Thompson & Wannemacher, Jr. 1986].

A chemical attack occurred on February 13, 1982 at Tuol Chrey, Kampuchea.

One of the victims died on March 16 and the concentrations of T-2 toxin were measured at postmortem, as shown in the table below.

Tissue	Oesophagus	Kidney	Lung	Large Intestine
Concentration (ppb)	25.1	6.8	8.5	88

[Mirocha *et al.* 1983].

Note For a review of trichothecene toxicology and potential effects on humans, see Pestka, Smolinski [2005]; Rotter *et al.* [1996]; Sudakin [2003].

Half-life <20 min.

Dose It has been reported that the trichothecenes were used as an agent of biological/chemical warfare ('yellow rain') [Mirocha *et al.* 1983; Rosen, Rosen 1982; Stark 2005].

Tabun

Anticholinesterase, Organophosphate Nerve Agent

$C_5H_{11}N_2O_2P = 162.1$

CAS—77-81-6

IUPAC Name Ethyl *N,N*-dimethylphosphoramidocyanidate

Synonyms Dimethylamidoethoxyphosphoryl cyanide; dimethylphosphoramidocyanidic acid ethyl ester; EA1205; GA; Gelan; Le100; Stoff-83; Trilon-83.

Chemical Properties Clear, colourless liquid with a faint fruity odour reminiscent of bitter almonds. Mp -50° . Bp 240° . Readily soluble in organic solvents. Freely soluble in water. Log *P* (octanol/water), -1.4 .

Gas Chromatography-Mass Spectrometry Column: SGE BPX5 capillary 5% phenyl 95% methylpolysiloxane ($30\text{ m} \times 0.32\text{ mm i.d.}$, $0.25\text{ }\mu\text{m}$). Carrier gas: He, 1.2 mL/min . Temperature programme: 50° for 2 min to 280° at $10^\circ/\text{min}$. EI ionisation at 70 eV. Limit of detection not reported [Gupta *et al.* 2005]. Column: DB5-MS ($25\text{ m} \times 0.22\text{ mm i.d.}$, $0.33\text{ }\mu\text{m}$). Carrier gas: He, 0.9 mL/min . Temperature programme: 40° for 2 min to 160° at $20^\circ/\text{min}$ to 310° at $30^\circ/\text{min}$ for 5 min. ATD, full scan mode. Limit of detection, 50 ng [Carrick *et al.* 2001].

Mass Spectrum

Quantification

Urine GC-MS Column: DB-5 capillary ($30\text{ m} \times 0.32\text{ mm i.d.}$, $0.25\text{ }\mu\text{m}$). Carrier gas: He. Temperature programme: 50° for 1.5 min to 250° at $40^\circ/\text{min}$ in 5 min for 5 min. SRM acquisition mode. Limit of detection, $17\text{ }\mu\text{g/L}$ [Driskell *et al.* 2002].

Other GC Water. Column: CP-Sil 19 ($50\text{ m} \times 0.32\text{ mm i.d.}$, $0.4\text{ }\mu\text{m}$). Temperature programme: 60° for 3 min to 70° at $5^\circ/\text{min}$ for 7 min to 180° at $10^\circ/\text{min}$ to 240° at $15^\circ/\text{min}$ for 12 min. Limit of detection, ng/L range [Degenhardt-Langelaan, Kientz 1996].

GC-MS Soil. Column: J and W DB-35MS capillary ($15\text{ m} \times 0.25\text{ mm i.d.}$). Temperature programme: 40° for 2 min to 280° at $10^\circ/\text{min}$ for 5 min. EI ionisation at 70 eV, full scan mode. Limit of detection not reported [D'Agostino *et al.* 2003].

LC-MS Spiked Food, Bottled Water, Canola Oil, Cornmeal and Honey. Column: Agilent Zorbax SB-C₁₈ ($50 \times 0.3\text{ mm i.d.}$, $1.8\text{ }\mu\text{m}$). Mobile phase: 0.1% trifluoroacetic acid in water : acetonitrile (95 : 5 to 50 : 50 over 15 min), flow rate $10\text{ }\mu\text{L/min}$. ESI, APCI, or FAIMS. Limit of quantification, 3 and $398\text{ }\mu\text{g/L}$ using APCI with and without FAIMS, respectively; limit of detection, 0.9 and $10\text{ }\mu\text{g/L}$ using APCI with and without FAIMS, respectively [Kolakowski *et al.* 2007]. Soil. Column: Zorbax C₁₈ SB ($150 \times 0.32\text{ mm i.d.}$, $5\text{ }\mu\text{m}$). Mobile phase: 0.1% trifluoroacetic acid in water : 0.1% trifluoroacetic acid in acetonitrile-water (95 : 5; 95 : 5 to 25 : 75 at 30 min), flow rate $10\text{ }\mu\text{L/min}$. ESI. Limit of detection not reported [D'Agostino *et al.* 2003]. Aqueous Samples. Column: Zorbax C₁₈ SB ($150 \times 0.32\text{ mm i.d.}$, $5\text{ }\mu\text{m}$). Mobile phase: 0.1% trifluoroacetic acid in water : 0.1% trifluoroacetic acid in acetonitrile-water (95 : 5; 99 : 1 to 25 : 75 over 30 min). ESI. Limit of detection not reported [D'Agostino *et al.* 1999].

Note For a review article on the chromatographic analysis of chemical warfare agents, see Witkiewicz *et al.* [1990] and Creasy *et al.* [1997].

Disposition in the Body Under neutral conditions, the principal hydrolysis pathway of tabun produces *O*-ethyl *N,N*-dimethylamidophosphoric acid and hydrogen cyanide. The former is then hydrolysed to dimethyl phosphoramidate followed by phosphoric acid. The first stage is relatively rapid while the latter stages of the pathway are relatively slow. Phosphorocyanidate may also be formed from dimethyl phosphoramidate. Under acidic conditions, hydrolysis to ethylphosphoryl cyanidate and dimethylamine occurs. The final product by all pathways is phosphoric acid [Munro *et al.* 1999].

Toxicity For a review of the toxicity of tabun, sarin and VX, see Munro [1994].

Tacrine

Anticholinesterase, Central Stimulant

$C_{13}H_{14}N_2 = 198.3$

CAS—321-64-2

IUPAC Name 1,2,3,4-Tetrahydroacridin-9-amine

Synonyms 1,2,3,4-Tetrahydro-9-acridinamine; tetrahydroaminoacridine.

Chemical Properties Mp 183° to 184°. pK_a 9.95 (20°). Log P (octanol/water), 2.71.

Tacrine Hydrochloride

$C_{13}H_{14}N_2 \cdot HCl = 234.7$

CAS—1684-40-8

Synonyms Cl-970; tetrahydroaminoacridine hydrochloride; THA.

Proprietary Names Cognex; Tacrinal.

Chemical Properties A pale yellow crystalline powder. Mp 283° to 284°. Soluble in water.

Thin-layer Chromatography System TA—R_f 0.43; system TB—R_f 0.05; system TC—R_f 0.04; system TL—R_f 0.10 (acidified iodoplatinate solution—positive).

Gas Chromatography System GA—RI 2165.

High Performance Liquid Chromatography System HA—k 1.6.

Ultraviolet Spectrum Aqueous acid—240 (A₁ = 2032a), 323, 336 nm; aqueous alkali—237, 317 nm.

Infrared Spectrum Principal peaks at wavenumbers 1650, 1590, 765, 1496, 774, 1176 cm⁻¹ (KBr disk).

Mass Spectrum Principal ions at m/z 198, 197, 170, 199, 182, 169, 77, 183.

Quantification

Plasma HPLC Column: Nucleosil CN (125 × 4.0 mm i.d., 5 μm). Mobile phase: 0.05 mol/L sodium phosphate buffer (pH 7.0):acetonitrile (45:55), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 365 nm). Retention time: 6.5 min. Limit of quantification, 1.0 μg/L, limit of detection, 0.4 μg/L [Chollet *et al.* 2000]. Column: Hypersil Phenyl (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: 4.4 mmol/L potassium dihydrogen phosphate (39:61), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 360 nm). Limit of quantification, 0.5 μg/L for tacrine and its metabolites [Aymard *et al.* 1998]. Column: LiChrospher RP-Select B (250 × 4 mm i.d., 5 μm). Mobile phase: 0.2 mol/L acetate buffer (pH 4):acetonitrile (87:13), flow rate 1.25 mL/min (0 to 16 min) and 2.5 mL/min (16 to 40 min). Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 365 nm). Retention time: 29–30 min. Limit of quantification, 2 nmol/L for tacrine, 2.5 nmol/L for 2- and 4-hydroxytacrine and 10 nmol/L for 1-hydroxytacrine, limit of detection, 2 nmol/L for tacrine and 1-hydroxytacrine and 0.5 nmol/L for 2- and 4-hydroxytacrine [Hansen *et al.* 1998]. Column: Brownlee-Spheri-5 Cyano (100 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile:0.01 mol/L sodium acetate buffer (pH 4.0, 30:70), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 240 nm, λ_{em} = 355 nm). Limit of quantification, 0.5 μg/L for tacrine and 4-hydroxytacrine, 1 μg/L for 2-hydroxytacrine and 0.925 μg/L for 1-hydroxytacrine [Haughey *et al.* 1994]. Column: Hypersil (100 × 4.6 mm i.d., 3 μm). Mobile phase: acetonitrile: 0.02 mol/L ammonium formate buffer (pH 2.75, 70:30), flow rate 1.5 mL/min. UV detection (λ = 240 nm). Limit of detection, 1 μg/L [Hsu *et al.* 1990].

Serum HPLC Fluorescence detection [Forsyth *et al.* 1988].

Urine HPLC See Plasma. Limit of quantification, 1202 nmol/L for tacrine, 1- and 2-hydroxytacrine and 4-hydroxytacrine; limit of detection, 80 nmol/L for tacrine, 30 nmol/L for 1-hydroxytacrine and 60 nmol/L for 2- and 4-hydroxytacrine [Hansen *et al.* 1998].

Disposition in Body Tacrine is rapidly absorbed from the gastrointestinal tract after oral administration, but there is large inter-individual variation in oral bio-availability and the extent of absorption decreases when administered with food. It is metabolised in the liver by the cytochrome P450 isozymes, principally CYP1A2, to several metabolites, the main one being 1-hydroxytacrine (velnacrine). Little unchanged drug is excreted in urine.

Therapeutic Concentration

Twelve patients with Alzheimer's disease sequentially given 9 doses of 10, 20 or 30 mg every 6 h had maximum steady-state plasma levels of 5.1, 20.7 and 33.9 μg/L, respectively [Cutler *et al.* 1990].

Twenty-four healthy mature volunteers (aged 50–76 years; mean, 64) were administered with a single 40-mg dose of tacrine after an 8 h overnight fast, 1 h before a standard breakfast, 15 min after the start of breakfast (i.e. during breakfast) and 2 h after a standard breakfast was finished. There was a 1 week washout period between doses. The mean maximum plasma concentration was 15.8 μg/L for the fasting individuals (i.e. after the overnight fast and before breakfast), 17.9 μg/L for the dose given 1 h before breakfast, 9.9 μg/L when tacrine was administered during breakfast and 11.6 μg/L when the dose was administered 2 h after breakfast. These concentrations were observed at 1.9, 1.7, 3.6 and 2.8 h, respectively [Welty *et al.* 1994].

Five patients with Alzheimer's disease who had had the disease for 2–12 years (aged 57 to 72 years) were administered 40–160 mg tacrine daily during a 12- to 31-month treatment period. The mean steady-state plasma concentrations were 1.3, 5.5, 11.9 and 30.0 μg/L for the 40-, 80-, 120- and 160-mg doses, respectively. After the morning 80-mg dose, the mean maximum plasma concentration was 8.7 μg/L observed at 1.3 h. The mean plasma concentration was 2.6–5.6 μg/L [Johansson *et al.* 1996].

Seven patients received tacrine 40–140 mg daily for Alzheimer's disease as part of a 6-week clinical trial. At the end of this period, patients had a mean concentration of 8.01 ± 7.07 μg/L in the plasma and 5.21 ± 6.00 μg/L in CSF 30 min after the morning dose (10–40 mg, given in the fasting state) [Grothe *et al.* 1998].

Toxicity A serum concentration >20 μg/L is associated with a high risk of adverse reaction.

A 75-year-old woman with Alzheimer's disease was treated with 40 mg tacrine daily for 14 months. She was admitted to hospital with jaundice and was very confused. Her liver span measured 13 cm. She had excessive levels of bilirubin in the blood and decreased transaminase levels. Drug-induced hepatotoxicity was suspected. All medications were stopped but transaminase levels decreased further and she had urosepsis and acute renal failure. She died 3 weeks after admission to hospital. The postmortem showed massive hepatic necrosis, which was believed to have been caused by tacrine

and possibly the production of toxic metabolites in the liver [Blackard *et al.* 1998].

Bioavailability 17% with a large inter-individual variation.

Half-life 1.5–2 h.

Protein Binding 55%.

Note For a review of the clinical pharmacokinetics of tacrine, see Madden *et al.* [1995]; for a review of the pharmacokinetics of cholinesterase inhibitors, see Jann *et al.* [2002]; for a review of the use and adverse effects of tacrine in patients with Alzheimer's disease, see Qizilbash *et al.* [2007].

Dose Up to 160 mg daily by mouth.

Tacrolimus

Immunosuppressant

C₄₄H₆₉NO₁₂ = 804.0

CAS—104987-11-3

Synonyms FK506; FR-900506; (3S,4R,5S,8R,9E,12S,14S,15R,16S,18R,19R,26aS)-5,6,8,11,12,13,14,15,16,17,18,19,24,25,26,26a-hexadecahydro-5,19-dihydroxy-3-[(1E)-2-[(1R,3R,4R)-4-hydroxy-3-methoxycyclohexyl]-1-methylethenyl]-14,16-dimethoxy-4,10,12,18-tetramethyl-8-(2-propenyl)-15,19-epoxy-3H-pyrido[2,1-c][1,4]oxazacyclotricosine-1,7,20,21(4H,23H)-tetrone.

Proprietary Names Prograf; Protopic.

Tacrolimus Monohydrate

C₄₄H₆₉NO₁₂·H₂O = 822.0

CAS—109581-93-3

Chemical Properties A white crystalline powder. Mp 127° to 129°. Practically insoluble in water; soluble in methanol, ethanol, acetone, ethyl acetate, trichloro-methane and diethylether; sparingly soluble in hexane and petroleum ether.

Liquid Chromatography-Mass Spectrometry Column: ODS Hypersil (100 × 2.1 mm i.d., 5 μm). Mobile phase: methanol; 5 mmol/L ammonium acetate (pH 9.0; 99:1), flow rate 0.3 mL/min. SIM *m/z* 802.5→168.2. Retention time: 0.97 min [Alak *et al.* 1997].

Column: RP C₁₈ Spherical (150 × 3.9 mm i.d., 5 μm). Mobile phase: methanol: water (90:10), flow rate 0.4 mL/min. NCI, SIM acquisition mode at *m/z* 803.7. Retention time: 5.2 min [Gonschior *et al.* 1995].

Column: C₁₈ Novapak (150 × 2.1 mm i.d., 4 μm). Column temperature: 50°. Mobile phase: methanol: 40 mmol ammonium acetate buffer (pH 5.1; 76:24), flow rate 0.2 mL/min. ESI, SIM acquisition mode at *m/z* 821.5→768.5. Retention time: 7.3 min (ammoniated adduct) [Taylor *et al.* 2000].

Ultraviolet Spectrum

Quantification

Blood LC-MS Limit of quantification, 0.25 μg/L [Taylor *et al.* 2000] Limit of detection, 0.10 μg/L [Alak *et al.* 1997]. Limit of quantification, 0.025 μg/L [Hill *et al.* 1997]. Limit of quantification, 200 μg/L [Gonschior *et al.* 1995].

Serum Immunoassay Limit of detection, 0.1 μg/L [Friob *et al.* 1991].

Urine LC-MS See Blood [Gonschior *et al.* 1995].

Disposition in the Body Absorption of tacrolimus after oral administration is erratic and generally poor. It undergoes extensive tissue distribution and metabolism is hepatic with >99% of the drug being metabolised. At least 15 metabolites have been detected and are produced mainly by demethylation and hydroxylation, via the hepatic cytochrome P450 enzyme (CYP3A), and some metabolism may occur in the gastrointestinal tract. Several hydroxylated and demethylated metabolites have been identified, including 13-O-desmethyl tacrolimus and 15-O-desmethyl tacrolimus. It is widely and extensively distributed throughout the tissues of the body after IV administration. Elimination is primarily via bile (>90% of an absorbed dose is excreted in bile as metabolites. <1% of the dose is excreted in urine as the unchanged drug. A peak plasma concentration of 0.4–5.6 μg/L is reached after a single oral dose of 0.15 mg/kg and 10–24 μg/L after IV infusion of 0.5 mg/kg over 2 h. Hepatic impairment causes increased plasma concentration, prolonged half-life and reduced clearance. Renal impairment causes no change in the pharmacokinetics.

Therapeutic Concentration The reference range is 0.5–2 μg/L and the therapeutic peak is 0.2–6 μg/L. In blood, the therapeutic reference concentration at its trough is 3–15 μg/L and its peak, 10–25 μg/L.

Ten African American (mean age, 32.2 years), 12 white (mean age, 44.6 years) and 12 Latin-American (mean age, 35.7 years) healthy patients were administered with a single, oral dose of 5 mg tacrolimus after an overnight fast. The mean maximum drug concentrations after the oral dose were 20.8, 37.8 and 33.0 μg/L for the 3 ethnic groups observed at 1.6, 1.3 and 1.3 h, respectively. For the IV dose, the mean concentrations were 28.3, 26.4 and 27.4 μg/L detected at the end of the infusion. The metabolite, 13-O-desmethyl tacrolimus, was observed at concentrations of 2.0, 4.8 and 3.6 μg/L for the ethnic groups at 1.3, 1.5 and 1.6 h, respectively following oral administration [Mancinelli *et al.* 2001].

Toxicity The toxic blood reference concentration is 12–15 μg/L.

A 54-year-old male patient waiting for a liver transplant was co-administered with mibefradil for the treatment of hypertension. He subsequently developed dizziness, fatigue and shoulder muscle ache as well as reversible renal impairment. Tacrolimus levels were observed at 54 μg/L (originally in the therapeutic range, 5–8 μg/L). Treatment with mibefradil was stopped and tacrolimus levels decreased to normal and all symptoms and clinical changes were reversed. It was decided that these toxic effects were due to an interaction between the 2 drugs [Ocran *et al.* 1999].

Bioavailability Oral: 5–67% (mean, 30%).

Half-life 43 h in healthy volunteers and 12–16 h in transplant patients.

Volume of Distribution Plasma, 5–65 L/kg; blood: 0.5–1.4 L/kg (1300 L).

Clearance Plasma, 0.6–5.4 (mean, 1.8) L/h/kg; blood: 0.03–0.09 (mean, 0.06) L/h/kg; also reported as 2.43 L/kg.

Distribution in Blood Tacrolimus is primarily associated with red blood cells and the blood: plasma ratio is between 4 and 39.

Protein Binding 77–99%. Predominantly to the non-lipoprotein fractions containing albumin and α₁-acid glycoprotein.

Dose IV administration: 0.1 mg/kg/day. Oral: 0.3 mg/kg/day.

Tadalafil

Phosphodiesterase 5 Inhibitor, Treatment of ED

$C_{22}H_{19}N_3O_4 = 389.4$

CAS—171596-29-5

Synonyms GF-196960; (6*R*,12*aR*)-2,3,6,7,12,12*a*-hexahydro-2-methyl-6-[3,4-(methylenedioxy)phenyl]pyrazino[1',2':1,6]pyrido[3,4-*b*]indole-1,4-dione; IC-351; weekend pill.

Proprietary Names *Cialis*; *Forzest*; *Tadacip*; *Zydalis*.

Chemical Properties White crystals from propan-2-ol. Mp 302° to 303°. Very slightly soluble in ethanol. Practically insoluble in water [O'Neil *et al.* 2006]. Log *P* (octanol/water), 1.7 [Wishart 2006].

High Performance Liquid Chromatography Column: C_{18} (250 × 9.4 mm i.d., 5 μm). Mobile phase: acetonitrile: water (1:1), flow rate 2 mL/min. UV detection ($\lambda = 225$ nm). Retention time: 7.4 min. Limit of quantification not reported [Zou *et al.* 2006a].

Ultraviolet Spectrum Principal peaks at 200, 285 nm [Cheng, Chou 2005]

Mass Spectrum Principal ions at *m/z* 268, 390, 269, 391, 413, 262, 270, 389.

Quantification

Plasma HPLC Hypersil ODS (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: 20 mmol/L phosphate buffer (pH 7; 35:65), flow rate 1.0 mL/min. UV detection ($\lambda = 290$ nm). Retention time: 15.5 min. Limit of quantification, 10 μg/L [Cheng, Chou 2005].

LC-MS Column: C_{18} (100 × 3.0 mm i.d., 3.5 μm). Mobile phase: 10 mmol/L ammonium formate: acetonitrile (pH 3.0; 10:90), flow rate 0.8 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 0.65 min. Limit of quantification, 10 μg/L [Ramakrishna *et al.* 2004].

Other HPLC Tablet. Column: Chiralpak AD packed with silica gel coated with amylase *tris*-(3,5-dimethylphenylcarbamate), 10 μm. Mobile phase: hexane: isopropyl alcohol (1:1), flow rate 0.75 mL/min. UV detection ($\lambda = 220$ nm). *K'*: 6*R*,12*aS*-isomer 3.12; 6*R*,12*aR*-isomer 6.61; 6*S*,12*aS*-isomer 9.72; 6*S*,12*aR*-isomer 12.05. Limit of quantification (on-column), 6*R*,12*aS*-isomer 0.60; 6*R*,12*aR*-isomer 0.90; 6*S*,12*aS*-isomer 1.20; 6*S*,12*aR*-isomer 1.80 [Gao *et al.* 2007]. Dietary Supplements. Column: C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: 0.01 mol/L ammonium formate (38:62), flow rate 1.0 mL/min. UV detection ($\lambda = 230$ nm). Retention time: tadalafil 12.6 min, vardenafil 15.7 min, sildenafil 16.6 min. Limit of quantification, tadalafil 1.02 mg/L, vardenafil 0.61 mg/L, sildenafil 0.67 mg/L [Zou *et al.* 2006b].

LC-MS Herbal Tablets. Column: Zorbax SB- C_{18} (150 × 2.1 mm i.d., 3.5 μm). Mobile phase: 0.1% formic acid:acetonitrile (95:5 to 5:95 over 15 min for 5 min), flow rate 0.2 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification not reported [Gratz *et al.* 2006]. Dietary Supplements. Column: C_{18} (150 × 2.0 mm i.d., 5 μm). Mobile phase: acetonitrile: 0.01 mol/L ammonium formate (38:62), flow rate 0.25 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification (on column), tadalafil 0.70 ng, vardenafil 0.07 ng, sildenafil 0.10 ng [Zou *et al.* 2006b]. Herbal Remedies. Column: C_{18} (125 × 3.0 mm i.d., 4 μm). Mobile phase: 10 mmol/L ammonium formate (pH 3.0): acetonitrile (95:5 for 5 min to 20:80 over 25 min for 10 min to 5:95 over 5 min for 25 min), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 23.7 min. Limit of detection (on column), 0.02 ng [Bogusz *et al.* 2006]. Herbal Preparations. Column: C_{18} (5 μm). Mobile phase: acetonitrile: 20 mmol/L ammonium acetate-0.2% formic acid (35:65 for 10 min to 80:30 over 5 min for 5 min), flow rate 1.0 mL/min. ESI, positive ion mode, SIR and UV detection ($\lambda = 292$ nm). Retention time: tadalafil 14.8 min, vardenafil 8.8 min, sildenafil 7.9 min. Limit of quantification, 1.1 μg/L [Zhu *et al.* 2005]. Herbal Tablets. Column: Novapak C_{18} (150 × 3.9 mm i.d., 4 μm). Mobile phase: 0.1% formic acid: acetonitrile: methanol (20:10:70). ESI, positive ion mode, SIM acquisition mode. Retention times: tadalafil 6.2 min, sildenafil 25 min, vardenafil 27 min. Limit of quantification not reported [Fleshner *et al.* 2005]. Tablets. Column: C_{18} (150 × 2.1 mm i.d., 5 μm). Mobile phase: 0.1% formic acid: acetonitrile (85:15 for 5 min to 10:90 over 10 min for 10 min), flow rate 0.4 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: tadalafil 13.1 min, vardenafil 10.8 min, sildenafil 11.6 min. Limit of detection on-column, 0.3 ng [Gratz *et al.* 2004].

CE Herbal Tablets. Column: fused silica capillary (total/effective length: 60/50 cm, 75 μm). Running buffer: 10 mmol/L phosphate buffer (pH 12.0) with 25 mmol/L SDS. UV detection ($\lambda = 222$ nm). Migration times: tadalafil 1.75 min, vardenafil 1.15 min, sildenafil 1.0 min. Limit of quantification, 2 mg/L; limit of detection, 0.61 mg/L [Rodriguez Flores *et al.* 2004].

Note For structure elucidation of tadalafil analogues in herbal products, see Blok-Tip *et al.* [2004]

Disposition in the Body Well absorbed after oral administration, with peak plasma concentrations attained within 2 h; the rate and extent of absorption are not affected by food. It is widely distributed into tissues. It is metabolised in the liver mainly by CYP3A4 and the major metabolite, the methylcatechol glucuronide, is inactive. Tadalafil is excreted, mainly as metabolites, in the faeces (61% of the dose) and to a lesser extent the urine (36% of the dose). Clearance may be reduced in the elderly and in patients with renal impairment.

Therapeutic Concentration

Fifteen healthy volunteers were administered 20 mg tadalafil daily for 15 days.

Mean peak plasma concentrations of tadalafil and its methylcatechol glucuronide metabolite were reported as follows:

	Day 1	Day 5	Day 15
Tadalafil			
C_{max} (μg/L)	352	514	481
Time (h)	2.0	2.0	2.0
Metabolite			
C_{max} (μg/L)	179	469	442
Time (h)	24	3.0	3.0

In separate studies, no diurnal effect was observed in tadalafil pharmacokinetics, and food had negligible effects on rate and extent of absorption [Forgue *et al.* 2006].

In a multi-centre study investigating the effects of intrinsic factors on tadalafil pharmacokinetics, groups of patients with various conditions were administered a single oral dose of 10 mg tadalafil. Peak plasma concentrations of tadalafil for patients grouped by age (young, mean age 36.3 years; elderly, mean age 70.7 years) or sex were reported as follows:

T

	Male	Female	Elderly	Young
C_{max} ($\mu\text{g/L}$)	142	140	196	183
Time (h)	3.5	3.5	2.0	2.5

Grouped by level of renal impairment:

	Normal function	Mild impairment	Moderate impairment
C_{max} ($\mu\text{g/L}$)	183	217	220
Time (h)	1.0	2.0	2.0

Grouped by level of renal impairment:

	Normal function	Very mild impairment	Mild impairment	Moderate impairment
C_{max} ($\mu\text{g/L}$)	180	133	146	101
Time (h)	2.5	3.0	2.0	2.5

No changes in pharmacokinetics of tadalafil were observed in patients with diabetes mellitus [Forgue *et al.* 2007].

Toxicity Rifampicin, an inducer of CYP3A4, has been shown to decrease the plasma concentrations of tadalafil. Phosphodiesterase type 5 inhibitors may potentiate the hypotensive effects of organic nitrates and are, therefore, contraindicated in patients receiving such drugs. The licensed product information recommends that if nitrate treatment is needed in a life-threatening situation then it should only be given at least 48 h after the last dose of tadalafil and under close medical supervision. There have been numerous reports of tadalafil (and related compounds) being misused recreationally, often in combination with 'party' drugs such as MDMA, GHB, ketamine and amyl nitrite ('poppers') [Smith, Romanelli 2005].

Bioavailability 25%.

Half-life Approximately 17.5 h.

Volume of Distribution Approximately 63.8 L.

Clearance Approximately 1.6 L/h.

Protein Binding Approximately 94%.

Dose Given orally in a usual dose of 10 mg at least 30 min before sexual intercourse and may be taken with or without food; the dose may be increased to 20 mg, or decreased to 5 mg, if necessary. In patients taking potent inhibitors of CYP3A4, such as ketoconazole or ritonavir, the dose of tadalafil should not exceed 10 mg once every 72 h.

Talbutal

Sedative, Barbiturate

$C_{11}H_{16}N_2O_3 = 224.3$

CAS—115-44-6

IUPAC Name 5-Butan-2-yl-5-prop-2-enyl-1,3-diazinane-2,4,6-trione

Synonym 5-(1-Methylpropyl)-5-(2-propenyl)-2,4,6(1H,3H,5H)-pyrimidinetrione

Proprietary Name *Lotusate*

Chemical Properties A white crystalline powder. It occurs in 2 polymorphic forms. Mp about 108°. Soluble 1 in 500 of water, 1 in 1 of ethanol, 1 in 2 of chloroform and 1 in 40 of ether. pK_a 7.9 (20°). Log *P* (octanol/pH 7.4), 1.3; (octanol/water), 1.5. **Colour Tests** Koppanyi-Zwicker test—violet; mercurous nitrate—black; vanillin reagent—brown-orange/violet.

Thin-layer Chromatography System TD— R_f 0.53; system TE— R_f 0.46; system TF— R_f 0.67; system TH— R_f 0.71; system TAD— R_f 0.60; system TAE— R_f 0.92.

Gas Chromatography System GA—talbutal RI 1703, talbutal-Me₂ RI 1600.

High Performance Liquid Chromatography System HG—*k* 7.20; system HH—*k* 4.70; system HX—RI 403; system HY—RI 370.

Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—239 nm ($A_1^1=415a$); 1 mol/L sodium hydroxide (pH 13)—255 nm ($A_1^1=313b$).

Infrared Spectrum Principal peaks at wavenumbers 1703, 1728, 1752, 1315, 1211, 829 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 167, 168, 41, 97, 124, 39, 57, 53.

Disposition in the Body

Toxicity The estimated minimum lethal dose is 2 g.

In one fatality involving talbutal, a blood concentration of 13 mg/L and a liver concentration of 305 $\mu\text{g/g}$ was reported [Baselt, Cravey 1977].

Dose 60 to 150 mg daily.

Baselt RC, Cravey RH (1977). A compendium of therapeutic and toxic concentrations of toxicologically significant drugs in human biofluids. *J Anal Toxicol* 1: 81-102.

Taltirelin

Nootropic, Thyroid Agent, Thyrotropin Releasing Hormone Analogue

$C_{17}H_{23}N_7O_5 = 405.4$

CAS—103300-74-9

IUPAC Name (4S)-N-[(2S)-1-[(2S)-2-Carbamoylpyrrolidin-1-yl]-3-(3H-imidazol-4-yl)-1-oxopropan-2-yl]-1-methyl-2,6-dioxo-1,3-diazinane-4-carboxamide

Synonyms N-[[[(4S)-Hexahydro-1-methyl-2,6-dioxo-4-pyrimidinyl]carbonyl]-1-histidyl-L-prolinamide; (S)-N-(1-methyl-4,5-dihydroorotyl)-L-histidyl-L-prolinamide.

Chemical Properties Crystals. Mp 72° to 75°.

Taltirelin Tetrahydrate

$C_{17}H_{23}N_7O_5 \cdot 4H_2O = 477.4$

CAS—201677-75-0

Synonym TA-0910

Proprietary Name Ceredist

Chemical Properties White, odourless crystals. Bp 72° to 75°. Soluble in water, acetic acid, and ethanol; slightly soluble in methanol and acetonitrile.

Quantification

Plasma LC-MS Column: Daisopak Sp-120-30DS-BP (150 × 2.0 mm i.d., 5 μm). Mobile phase: methanol-0.1% formic acid (3:37):methanol-0.1% formic acid (9:1; 100:0 for 3 min to 0:100 over 1 min for 3 min), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 3 min. Limit of quantification, 17 ng/L [Horimoto *et al.* 2002].

Other LC-MS Rat Plasma. Column: L-column ODS (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: water: 1 mol/L ammonium formate (80:20:0.01), flow rate 1 mL/min. API, MRM acquisition mode. Limit of quantification, 5 μg/L [Urayama *et al.* 2001].

Dose Taltirelin hydrate is used in the treatment of spinocerebellar degeneration at doses from 5 mg twice daily.

Horimoto S *et al.* (2002). Determination of taltirelin, a new stable thyrotropin-releasing hormone analogue, in human plasma by high-performance liquid chromatography turbo-ionspray ionization tandem mass spectrometry. *J Pharm Biomed Anal* 30: 1361-1369.

Tamsulosin

α_1 -Adrenoceptor Antagonist, Treatment of BPH

$C_{20}H_{28}N_2O_5S = 408.5$

CAS—106133-20-4

IUPAC Name 5-[(2R)-2-[2-(2-Ethoxyphenoxy)ethylamino]propyl]-2-methoxybenzenesulfonamide

Synonym 5-[(2R)-2-[[2-(2-Ethoxyphenoxy)ethyl]amino]propyl]-2-methoxybenzenesulfonamide.

Chemical Properties Mp 254° to 256°. pK_a 8.4 (secondary amine), 10.2 (sulfonamide). Log P (octanol/pH 6.9), 0.51. Stock solutions were stable for at least 6 months. Tamsulosin in serum and aqueous humour was stable after 3 freeze-thaw cycles and after 4 h at room temperature [Keski-Rahkonen *et al.* 2007]. Stock solutions were stable after multiple freeze-thaw cycles. Processed plasma samples were stable at room temperature for 6 days. Plasma samples were stable at -18° for 5 months and thawed plasma samples were stable for 24 h at room temperature [Macek *et al.* 2004]. Tamsulosin was stable for at least a year in plasma and urine and for at least 3 months in plasma dialysate stored at -20° [Matsushima *et al.* 1997].

Tamsulosin Hydrochloride

$C_{20}H_{28}N_2O_5S \cdot HCl = 445.0$

CAS—106463-17-6

Synonyms LY-253351; R(-)-YM-12617; YM-617; YM-12617-1.

Proprietary Names Alna; Flomax; Harnal; Omiz; Omnic; Pradif.

Chemical Properties White crystals. Mp 228° to 230°. It is sparingly soluble in water and methanol; slightly soluble in glacial acetic acid and ethanol; practically insoluble in ether.

High Performance Liquid Chromatography Column: Nucleosil 5C₁₈ (150 × 4.0 mm i.d., 5 μm). Mobile phase: 100 mmol/L potassium dihydrogen phosphate (pH 4.5): acetonitrile-100 mmol/L potassium dihydrogen phosphate (pH 4.9, 20:80 for 5 min to 100:0 for 5 min, to 0:100 over 60 min for 60 min), flow rate 1 mL/min. UV detection ($\lambda = 275$ nm). Retention time: 80 min [Soeishi *et al.* 1996a].

Ultraviolet Spectrum Aqueous acid (methanol)—225 nm, 280 nm.

Infrared Spectrum Principal peaks at wavenumber 1500, 1340, 1255, 1165 cm⁻¹.

Mass Spectrum Principal ions at m/z 409, 271, 257, 228, 208, 70.

Quantification

Plasma HPLC Column: Lichrocart Purospher StarRP 18e (55 × 4 mm i.d., 3 μm). Mobile phase: acetonitrile: 30 mmol/L potassium dihydrogenphosphate (25:75), flow rate 1.2 mL/min. Fluorescence detection ($\lambda_{ex} = 228$ nm, $\lambda_{em} = 326$ nm). Limit of quantification, 0.397 μg/L [Macek *et al.* 2004]. Column: Nucleosil S1100-5 normal phase (250 × 4 mm i.d.). Mobile phase: benzene: methanol (100:1). Fluorescence detection ($\lambda_{ex} = 352$ nm, $\lambda_{em} = 500$ nm). Limit of quantification, 0.5 μg/L [Matsushima *et al.* 1997].

LC-MS [Kscycinska *et al.* 2006]. Column: Symmetry C₁₈. Mobile phase: 0.03% formic acid: acetonitrile (30:70). ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 100 ng/L [Ramakrishna *et al.* 2005]. Column: C₁₈ reversed phase. Mobile phase: methanol: water: acetic acid: triethylamine (620:380:1.5:1.5). ESI, positive ion mode, SIM acquisition mode. Limit of detection, 0.2 μg/L [Din *et al.* 2002]. Column: J'sphere ODS-80H (75 × 4.6 mm i.d., 5 μm). Mobile phase: 50 mmol/L acetic acid (pH 4), flow rate 0.5 mL/min. API, ESI, SRM acquisition mode. Limit of detection, 0.5 μg/L [Matsushima *et al.* 1997].

Serum LC-MS Column: XTerra C₈ (50 × 2.1 mm i.d., 3.5 μm). Mobile phase: water-formic acid (100:0.1): water-acetonitrile-formic acid (50:50:0.1; 90:10 to 0:100 at 5 min to 90:10 at 6 min for 2 min), flow rate 0.2 mL/min. ESI, positive ion mode. Limit of quantification, 0.1 μg/L [Keski-Rahkonen *et al.* 2007].

Urine LC-MS See Plasma. Limit of detection, 1 μg/L [Matsushima *et al.* 1997].

Aqueous Humour LC-MS See Serum [Keski-Rahkonen *et al.* 2007].

Disposition in the Body Tamsulosin is absorbed from the gastrointestinal tract; 90% after oral administration. The extent and rate of absorption is reduced in the presence of food. It is distributed into extracellular fluid in the body. The drug is metabolised slowly in the liver by hepatic metabolism whilst first-pass metabolism is negligible. It is mainly metabolised by the cytochrome P₄₅₀ CYP3A enzyme and less than 10% of the dose is excreted in urine unchanged. The metabolites of tamsulosin hydrochloride undergo extensive conjugation to glucuronide or sulfate prior to renal excretion. It is excreted mainly in urine as metabolites and some unchanged drug. There are linear kinetics following single and multiple doses. Steady-state concentrations have been observed by the fifth day. Tamsulosin is highly bound to α_1 -acid glycoprotein. There appears to be no or little possibility of binding interactions between tamsulosin and other drugs in clinically concomitant use, despite its strong binding to α_1 -acid glycoprotein [Matsushima *et al.* 1999]. In patients with renal impairment, the pharmacokinetics of tamsulosin are affected by the change in protein binding that is associated with alteration of plasma α_1 -acid glycoprotein concentration, but are not largely affected by the decrease in the renal excretion. Although total tamsulosin levels increased as plasma protein binding increased, unbound tamsulosin levels (which are directly associated with the pharmacological effects) remained unchanged in these patients [Koiso *et al.* 1996], indicating that no dose modification is required in symptomatic BPH patients with renal impairment [Wolzt *et al.* 1998]. There are no data available on the hepatic-impaired.

Therapeutic Concentration

Young, healthy, male volunteers were administered with 0.4 mg tamsulosin (as modified-release tablets) and the median peak plasma concentration was 16 μg/L. This was reached after 5 h and decreased to 2 μg/L at around 23.5 h [Taguchi *et al.* 1998].

T

Four healthy males were administered with a single oral dose of 0.2 mg tamsulosin. The mean peak plasma concentration of the unchanged drug was 13.0 µg/L observed within the hour [Soeishi *et al.* 1996b].

Toxicity

Note For a case of contact dermatitis in a 46-year-old male after tamsulosin ingestion see Lijnen, de Graaf [2003] and for a case of unintentional overdose in a 78-year-old female see Anand *et al.* [2005].

Half-life 5–7 h. Prolonged in the elderly. Due to absorption rate-controlled pharmacokinetics, the apparent half-life is ≈9–13 h in healthy individuals and 14–15 h in the target population.

Bioavailability 100%.

Volume of Distribution Steady state after intravenous administration, 16 L or 0.2 L/kg.

Clearance 2.88 L/h or 48 mL/min.

Distribution in Blood Blood:plasma ratio is 0.53.

Protein Binding 94–99%, primarily to α₁ acid glycoprotein.

Dose 0.4 to 0.8 mg daily.

Tansospirone

Anxiolytic, Antidepressant

C₂₁H₂₉N₅O₂ = 383.5

CAS—87760-53-0

Synonym (3α,4β,7β,7α)-Hexahydro-2-[4-[4-(2-pyrimidinyl)-1-piperazinyl]-butyl]-4,7-methano-1H-isoindole-1,3(2H)-dione

Chemical Properties Crystals. Mp 112° to 113.5°.

Tansospirone Citrate

C₂₁H₂₉N₅O₂·C₆H₈O₇ = 575.6

CAS—112457-95-1

Synonyms Metanopirone citrate; SM-3997.

Proprietary Name Sediel

Chemical Properties Crystals. Mp 169.5° to 170°.

Tansospirone Hydrochloride

C₂₁H₂₉N₅O₂·HCl = 420.0

Chemical Properties Crystals from isopropanol. Mp 227° to 229°.

Disposition in the Body Tansospirone is metabolised to 1-(2-pyrimidinyl)-piperazine (1-PP). Maximum plasma concentrations after oral administration are reached in 0.5 to 2 h and are 3- to 8-fold higher for the metabolites than the parent drug. Approximately 70% of the administered drug is excreted in urine, with only 0.1% of the dose excreted as the unchanged drug. Dose-dependent pharmacokinetics do not seem to occur.

Therapeutic Concentration The maximum plasma concentration after a 30 mg dose is 3 µg/L.

Half-life Parent drug, 2 to 3 h; metabolite, 3 to 5 h.

Protein Binding Parent drug, 30.4%; metabolite, 1-PP, 87.5%.

Note For a review of tansospirone, see Barradell and Fitton [1996].

Dose 30 or 60 mg daily.

Barradell LB, Fitton A (1996). Tansospirone. *CNS Drugs* 5(2): 147–153.

Taurolin

Antibacterial

C₇H₁₆N₄O₄S₂ = 284.4

IUPAC Name 4-[(1,1-Dioxo-1,2,4-thiadiazinan-4-yl)methyl]-1,2,4-thiadiazinane 1,1-dioxide

Synonyms 4,4'-Methylenebis(perhydro-1,2,4-thiadiazine-1,1-dioxide)

Proprietary Name Tauroflex

Chemical Properties White crystalline powder. Mp 172° to 174°. Soluble 1 in 100 of water. Poorly extracted by ether from aqueous acid or alkaline solutions.

Thin-layer Chromatography System T1—R_f 0.52 (location reagent potassium permanganate spray, positive reaction).

Gas Chromatography System G2/225—no peaks within 30 min; system G4/225—no peaks within 30 min.

Infrared Spectrum Principal peaks at wavenumbers 913 or 1143 or 1312 cm⁻¹ (KBr disk).

Teclotiazide

Peripheral Vasodilator, Rubefacient

C₈H₇C₁₄N₃O₄S₂ = 415.1

CAS—4267-05-4

IUPAC Name 6-Chloro-1,1-dioxo-3-(trichloromethyl)-3,4-dihydro-2H-benz[e][1,2,4]thiadiazine-7-sulfonamide

Synonyms 6-Chloro-3,4-dihydro-7-sulfamoyl-3-trichloromethyl-2H-1,2,4-benzothiadiazine 1,1-dioxide; 6-chloro-3,4-dihydro-3-trichloromethyl-2H-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide; teclotiazidium; tetrachloromethiazide; 3-trichloromethylhydrochlorothiazide.

Chemical Properties Colourless liquid. Bp 114° to 116°. Soluble in water, oil and chloroform. Log P (octanol/water) 1.16 [Meylan, Howard 1995] 1.1 [National Institutes of Health 2008].

Thin-layer Chromatography System T1—R_f 0.62 (location reagent acidified iodoplatinate spray, positive reaction).

Dose It is used as a topical application in creams and ointments.

Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol-water partition coefficients. *J Pharm Sci* 84: 83–92.

National Institutes of Health (2008). *Thurlyl Nicotinate*. http://pubchem.ncbi.nlm.nih.gov/summary/summary.cgi?cid=6260&loc=ec_rcs (accessed 20 June 2008).

Tegaserod

5-HT₄ Partial Agonist, Treatment of Irritable Bowel Syndrome

C₁₆H₂₃N₅O = 301.4

CAS—145158-71-0

IUPAC Name 1-[[*(Z)*-[5-(Hydroxymethyl)indol-3-ylidene]methyl]amino]-2-pentylguanidine

Synonym 2-[(5-Methoxy-1*H*-indol-3-yl)methylene]-*N*-pentylhydrazinecarboximidamide

Chemical Properties Mp 155°.

Tegaserod Maleate

C₁₆H₂₃N₅O₄·C₄H₄O₄ = 417.5

CAS—189188-57-6

IUPAC Name 1-[[5-(Methoxyindol-3-yl)methylene]amino]-3-pentylguanidine maleate

Synonym SDZ-HTF-919

Proprietary Names Altezerod; Colonaïd; Coloserod; Distimax; Procinet; Tegarod; Tegasis; Tegibs; Tegod; Ther; Zelmac; Zelnorm.

Chemical Properties A white/off-white crystalline powder. Slightly soluble in ethanol and very slightly soluble in water. Plasma samples were stable for 8 h at room temperature (25°), over three freeze–thaw cycles in 30 days, and for 30 days at below –70° [Zou *et al.* 2008].

Mass Spectrum Principal ions at *m/z* 303, 173.

Quantification

Plasma GC-MS Column: CP SIL8 CB fused silica capillary (25 × 0.25 mm). Carrier gas: He. CI, negative ion mode. Limit of quantification, 0.1 µg/L [Appel-Dingemans *et al.* 1999].

HPLC Column: Agilent Zorbax SB C18 (100 × 2.1 mm, 3.5 µm). Mobile phase: methanol:5 mmol/L ammonium acetate (pH 3.5; 75:25), flow rate 0.2 mL/min. Positive ion mode, MRM acquisition mode. Limit of quantification, 0.05 µg/L [Zou *et al.* 2008].

Disposition in the Body Metabolised in the gastrointestinal tract by hydrolysis, oxidation and conjugation. The main metabolite produced is 5-methoxyindole-3-carboxylic acid glucuronide. Direct glucuronidation may also occur, producing 3 isomeric *N*-glucuronide metabolites. Approximately two-thirds of the drug is excreted unchanged in faeces, with <3% of the remainder excreted in urine as the main metabolite.

Therapeutic Concentration

Thirty-six healthy Chinese volunteers were administered 4, 6 or 12 mg tegaserod maleate orally. Peak plasma concentrations were 1.25 ± 0.53, 2.21 ± 0.52 and 4.34 ± 1.66 µg/L, respectively, attained at 1.00 ± 0.21, 1.05 ± 0.28 and 1.04 ± 0.16 h, respectively [Zou *et al.* 2008].

Ten healthy men and women (mean age 45 years) and 10 patients with severe renal impairment (mean age 44 years) were administered a single 12 mg oral dose of tegaserod maleate. Mean peak plasma concentrations of 5.1 ± 2.2 and 4.7 ± 2.3 µg/L were reached, respectively, ~1 h after dosing [Swan *et al.* 2003].

Eighteen healthy male and female volunteers (aged 21 to 36 years) were administered 2, 6 or 12 mg doses of tegaserod after an overnight fast on day 1. They continued to fast for another 4 h and were then administered the same doses twice daily for 5 days. There was no accumulation in this dose range and the maximum plasma concentrations were 0.7 ± 0.3, 2.7 ± 1.2 and 5.6 ± 2.9 µg/L for the 3 dose regimens, respectively, reached after ~1 h. [Appel-Dingemans *et al.* 2001a].

Four groups of 10 healthy volunteers (young male, young female, elderly male, and elderly female) were administered a single 12 mg dose of tegaserod maleate after an overnight fast and fasted for 4 h after dosing. Mean peak plasma concentrations of 6.5 ± 2.3 and 5.2 ± 1.3 µg/L were reached for

elderly and young women, respectively, and 5.1 ± 1.9 and 5.5 ± 3.1 µg/L for the elderly and young men, respectively. These concentrations were observed 1 h after dosing. [Appel-Dingemans *et al.* 2001b].

A single-dose and subsequent twice-daily multiple dose study in which 3 cohorts of 12 men (8 treated, 4 controls) received 25, 50 or 100 mg tegaserod for 14 days showed that peak plasma concentrations were reached between 1.3 and 1.7 h. Mean peak plasma concentrations were 10 ± 4, 16 ± 6 and 36 ± 12 µg/L for 25, 50 and 100 mg after a single dose and 8 ± 3, 12 ± 5 and 38 ± 17 µg/L after multiple doses at each dose, respectively [Appel *et al.* 1997].

Note For a review article on the pharmacokinetics of tegaserod, see Appel-Dingemans [2002].

Toxicity On March 30 2007, the FDA asked for *Zelnorm* to be withdrawn from the US market. Data collected in over 18 000 patients showed adverse cardiovascular events in 13 of 11 614 patients on *Zelnorm* treatment (0.11%) compared with 1 of 7031 patients on placebo (0.01%).

Bioavailability Approximately 10%.

Half-life Approximately 8.5 h.

Volume of Distribution Approximately 368 L.

Clearance Plasma, approximately 77 L/h.

Protein Binding Approximately 98% to α1-acid glycoprotein.

Dose 6 mg of tegaserod maleate twice daily.

Teicoplanin

Antibacterial

CAS—61036-62-2 (teichoplanin); 61036-64-4 (teichoplanin A₂)

Synonyms A-8327; DL-507-IT; L-12507; MDL-507; teichomycin A₂.

Proprietary Names Targocid; Targosid; Teicomid.

Chemical Properties A glycopeptide antibiotic obtained from cultures of *Actinoplanes teichomyceticus*. An amorphous powder. Mp 260°. Soluble in aqueous solutions at pH 7, in propylene glycol, dimethylformamide and dimethylsulfoxide; partially soluble in methanol and ethanol; insoluble in carbon tetrachloride, acetone, butanol, ethylether and in diluted mineral acids.

High Performance Liquid Chromatography Column: RP C₁₈ (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile: 15.4 mmol/L sodium dihydrogen phosphate(5:95)-acetonitrile:sodium dihydrogen phosphate (75:25; 90:10 for 5 min; to 70:30 in 10 min, for 20 min; to initial conditions over 12 min), flow rate 1 mL/min. UV detection (λ = 214 nm). Retention time: component A₃, 13.7 min; A₂-1, 18.7 min; A₂-2, 20.0 min; A₂-3, 21.0 min; A₂-4, 25.0 min; A₂-5, 26.3 min [Jehl *et al.* 1988].

Column: RP C₁₈ (150 × 3.9 mm i.d., 5 µm). Mobile phase: 0.01 mol/L aqueous tetrabutylammonium phosphate solution (pH 7.5):methanol:*n*-butanol

T

(10:10:1), flow rate 1.3 mL/min. Fluorescence detection ($\lambda_{\text{ex}} = 390 \text{ nm}$; $\lambda_{\text{em}} = 490$). Retention time: A₂-1, 10.2 min; A₂-2, 13.7 min; A₂-3, 15.7 min; A₂-3a, 17.9 min; A₂-4, 23.2 min; A₂-5, 25.4 min [Joos, Lüthy 1987].

Ultraviolet Spectrum Aqueous acid (0.1 mol/L hydrochloric acid)—278 nm; aqueous alkali (0.1 mol/L sodium hydroxide)—297 nm.

Quantification

Blood HPLC UV detection ($\lambda = 214 \text{ nm}$). Limit of detection, 0.5 mg/L [Jehl *et al.* 1988].

Plasma HPLC Limit of quantification, 0.09 mg/L, limit of detection 0.03 mg/L [Cociglio *et al.* 1998]. UV detection ($\lambda = 210 \text{ nm}$). Limit of detection, 0.05 mg/L [Taylor *et al.* 1991]. UV detection ($\lambda = 240 \text{ nm}$). Limit of detection, 0.2 mg/L [Georgopoulos *et al.* 1989]. UV detection ($\lambda = 240 \text{ nm}$). Limit of detection, 0.1 mg/L [Riva *et al.* 1987].

Serum HPLC Fluorescence detection ($\lambda_{\text{ex}} = 390 \text{ nm}$; $\lambda_{\text{em}} = 490 \text{ nm}$). Limit of detection, 0.5 mg/L [Joos, Lüthy 1987]. UV detection ($\lambda = 210 \text{ nm}$). Limit of detection, 5 mg/L [Levy *et al.* 1987].

Urine HPLC See Blood [Jehl *et al.* 1988]. See Plasma [Riva *et al.* 1987].

Review For a comparison of methods for the determination of telmisartan, see Awni *et al.* [1991].

Disposition in the Body Telmisartan is a mixture of several components and the pharmacokinetics of individual components vary slightly depending on their lipophilicity. The drug is poorly absorbed after oral administration and therefore administered by the parenteral route. It is well absorbed after IM injection with a bioavailability of 90% and it rapidly penetrates tissues including skin, fat and bone. Highest concentrations are observed in the kidneys, trachea, lungs and adrenals. Penetration into CSF is poor. It is taken up into white blood cells. No metabolites have been identified and it is excreted almost entirely by glomerular filtration in the urine as unchanged drug. Approximately 80% is excreted in urine and a minor amount in faeces. It is not removed by haemodialysis.

Therapeutic Concentration The trough serum therapeutic concentration range is 10–40 mg/L.

Telmisartan was administered to 6 healthy males, aged 22–23 years old, as a single IM dose of 3 mg/kg, an IV dose of 3 mg/kg or 6 mg/kg after an overnight fast and continued fasting for 2 h after dosing. The mean peak plasma concentrations were 7.12, 53.48 and 111.81 mg/L at 2.02 h and by the end of the infusion, respectively [Verbist *et al.* 1984].

Toxicity The toxic serum concentration is 200 mg/L.

Several overdoses of 100 mg/kg daily administered to a 4-year-old and an 8-year-old neutropenic paediatric patient by mistake, resulted in high plasma concentrations up to 300 mg/L but no symptoms or laboratory abnormalities were observed [Sanofi-aventis 2006].

Bioavailability 90%.

Half-life Plasma half-life, 30 to over 160 h in normal subjects (depending on the sampling time), increased in renal impairment; an effective half-life of about 60 h has been suggested in calculating dosage regimens.

Volume of Distribution 0.9–1.6 L/kg.

Clearance Plasma clearance, 0.18 mL/min/kg.

Protein Binding 90–95%.

Note For reviews of telmisartan, see Wilson [2000] and Brogden and Peters [1994].

Dose Initially 400 mg IV followed by 200 mg IV or IM on each subsequent day of treatment.

Telmisartan

Angiotensin II Receptor Antagonist

C₃₃H₃₀N₄O₂ = 514.6

CAS—144701-48-4

IUPAC Name 2-[4-[[4-Methyl-6-(1-methylbenzimidazol-2-yl)-2-propylbenzimidazol-1-yl]methyl]phenyl]benzoic acid

Synonyms BIBR-277-SE; BIBR-277; 4'-[(1,4'-dimethyl-2'-propyl[2,6'-bi-1H-benzimidazol]-1'-yl)methyl]-[1,1'-biphenyl]-2-carboxylic acid.

Proprietary Names Micardis; Pritor.

Chemical Properties A white to off-white, odourless crystalline powder. Mp 261° to 263°. Practically insoluble in water; sparingly soluble in strong acid; soluble in strong base.

Ultraviolet Spectrum

Quantification

Plasma HPLC Fluorescence detection ($\lambda_{\text{ex}} = 300 \text{ nm}$; $\lambda_{\text{em}} = 385 \text{ nm}$). Limit of quantification, 1 µg/L [Stangier *et al.* 2000a]. Fluorescence detection ($\lambda_{\text{ex}} = 305 \text{ nm}$; $\lambda_{\text{em}} = 365 \text{ nm}$). Limit of quantification, 0.5 µg/L [Stangier *et al.* 2000b].

Dialysate samples HPLC See Plasma [Stangier *et al.* 2000b].

Disposition in the Body After oral administration, telmisartan is rapidly absorbed and the peak concentration is achieved within 0.5 to 1 h. Most of a dose is eliminated unchanged in faeces via biliary excretion (>97%) with minute amounts detected in urine. Telmisartan is metabolised to form its acylglucuronide (pharmacologically inactive) and this is the only metabolite that has been detected in human plasma and urine. The glucuronide makes up approximately 11% of the plasma concentration of the drug.

Therapeutic Concentration

Thirteen healthy males (mean age, 51.2 years; range, 33 to 62 years) and 13 patients with hepatic impairment (mean, 53.5 years; range, 44 to 60 years) were fasted overnight and then administered 20 mg telmisartan. After a 14 day 'wash-out' period, another dose of 120 mg was given to the individuals. After the 20 mg dose, mean peak plasma concentrations of 105 (range, 10.5 to 265) µg/L were observed for the patients and 16.2 (range, 7.8 to 267) µg/L for the healthy individuals. These were detected in a time range between 0.5 and 4.0 h. After the 120 mg, the mean peak concentration for the patients was 1520 (514 to 3280) µg/L and 475 (167 to 760) µg/L for the healthy individuals. These concentrations were observed at a time range between 0.5 and 2.0 h [Stangier *et al.* 2000c].

Six patients with severe renal insufficiency and undergoing regular maintenance dialysis, aged 37 years (range, 21 to 46 years) and 12 healthy males (mean age, 51.2 years; range, 33 to 62 years) were fasted overnight and then administered with a 120 mg dose telmisartan. The healthy individuals reached a mean peak plasma concentration of 438 µg/L after 1 h. The patients receiving the dose between dialysis periods reached concentrations of 100 µg/L at 1 h and for those receiving telmisartan during dialysis, the peak concentration was 169 µg/L at 0.5 h [Stangier *et al.* 2000b].

Bioavailability Administration with food slightly reduces the bioavailability and this is also dose dependent. With a 40 mg dose the absolute bioavailability is 42% and with a 160 mg dose, 58%.

Half-life 24 h.

Volume of Distribution 500 L.

Clearance Plasma clearance, >800 mL/min.

Protein Binding >99.5% bound to, mostly, albumin and α_1 -acid glycoprotein.

Dose The usual daily dose is 40 mg.

Temazepam

Benzodiazepine, Hypnotic

C₁₆H₁₃ClN₂O₂ = 300.7

CAS—846-50-4

IUPAC Name 7-Chloro-3-hydroxy-1-methyl-5-phenyl-3H-1,4-benzodiazepin-2-one

Synonyms 7-Chloro-1,3-dihydro-3-hydroxy-1-methyl-5-phenyl-2H-1,4-benzodiazepin-2-one; ER-115; K-3917; N-methyloxazepam; oxydiazepam; Ro-5-5345; temazepamum; Wy-3917.

Proprietary Names *Eulhynos*; *Euiynos*; *Gelthix*; *Levanxene*; *Levanxol*; *Maeva*; *Nocturne*; *Normison*; *Nortem*; *Perdorm*; *Planum*; *Remestan*; *Restoril*; *Somapam*; *Temaze*; *Temtabs*; *Tenox*.

Chemical Properties A white to almost white crystalline powder. Mp 156° to 159° (crystals from cyclohexane). Practically insoluble to very slightly soluble in water; soluble 1 in 10 of ethanol and 1 in 10 of chloroform; freely soluble in dichloromethane. pK_a 1.6. Log P (octanol/water), 2.20 [Mullett, Pawliszyn 2001]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Colour Test Formaldehyde-sulfuric acid—orange.

Temozolomide

Antineoplastic

$C_6H_6N_6O_2 = 194.2$
CAS—85622-93-1

IUPAC Name 3-Methyl-4-oxoimidazo[5,1-d][1,2,3,5]tetrazine-8-carboxamide

Synonyms BRN-5547136; CCRG-81045; 3,4-dihydro-3-methyl-4-oxoimidazo[5,1-d]-1,2,3,5-tetrazine-8-carboxamide; MB 39831; methazolastone; NSC-632856.

Proprietary Name Temodal

Chemical Properties A white to light tan/pink powder. Mp 212°.

High Performance Liquid Chromatography Column: ODS Ultrasphere (150 × 4.6 mm i.d., 5 μm). Mobile phase: aqueous acetic acid (0.1%): acetonitrile (90:10), flow rate 1.0 mL/min. IS: ethazolastone. UV detection (λ = 316 nm). Retention time: temozolomide, 2.7 min; IS, 5.0 min [Kim *et al.* 2001].

Column: SCD-100 Synchronapak, (150 × 4.6 mm i.d., 5 μm). Mobile phase: ammonium acetate (0.02 mol/L): acetonitrile (92:8), flow rate 1.1 mL/min. IS: hydrochlorothiazide. UV detection (λ = 316 nm). Retention time: MTIC, 4.5 min; IS, 6.5 min [Kim *et al.* 1997].

Column: (analytical) RP HP ODS Hypersil (100 × 4.6 mm i.d., 5 μm); (guard) HP ODS Hypersil (20 × 4.0 mm i.d., 5 μm). Mobile phase: methanol: acetic acid (0.5%) (10:90), flow rate 1.0 mL/min. UV detection (λ = 330 nm). IS: ethazolastone. Retention time: 3.2 min; IS, 7.4 min [Shen *et al.* 1995].

Ultraviolet Spectrum Ethanol—327 nm.

Quantification

Plasma HPLC UV detection (λ = 316 nm). Limit of quantification, 0.1 mg/L [Kim *et al.* 2001]. UV detection (λ = 316 nm). Limit of quantification, 0.01 mg/L [Kim *et al.* 1997]. Limit of quantification, 0.2 mg/L [Shen *et al.* 1995].

Urine HPLC Limit of quantification, 2.0 mg/L, see Plasma [Shen *et al.* 1995].

Disposition in the Body Temozolomide is rapidly and completely absorbed after oral administration, with peak plasma concentrations observed within 0.5 to 1.5 h after administration. Food reduces the rate and the extent of absorption. Peak concentrations are reduced by ~32%, and the time to reach these concentrations is extended to over 2 h after a high-fat breakfast. Temozolomide undergoes spontaneous non-enzymatic hydrolysis to its active metabolite 5-(3-methyltriazen-1-yl)imidazole-4-carboxamide (MTIC), the hydrolysis of which is faster in alkaline pH compared with neutral pH. MTIC is further hydrolysed to 5-amino-imidazole-4-carboxamide (AIC). Temozolomide is also metabolised to the temozolomide acid metabolite. The drug is largely eliminated by the kidneys, about 5 to 10% as the unchanged drug. The majority of the dose is recovered in urine, and a small amount in the faeces. Temozolomide is detected mainly as AIC, the unchanged drug, the temozolomide acid metabolite and other unidentified polar metabolites.

Therapeutic Concentration

Twenty-four patients with solid malignancies untreatable with conventional therapy, aged 32 to 78 years, were fasted 8 h prior to treatment and for an additional 2 h after dosing. All were administered a single oral dose of 100, 150 or 200 mg/m² daily for 5 consecutive days. On day 1, the mean peak plasma concentration was 5.4 mg/L for the 100 mg/m² dose, 7.7 mg/L for the 150 mg/m² dose and 11.0 mg/L for the 200 mg/m² dose. These concentrations were observed at 1.0, 0.85 and 0.89 h, respectively. On day 5 the concentrations were 6.4, 9.9 and 16.0 mg/L for the three doses at 1.0, 0.64 and 0.53 h, respectively [Hammond *et al.* 1999].

Fifteen patients with a short life expectancy of ~12 weeks, and with histologically confirmed malignancies untreatable by standard therapy, aged 25 to 71 years (mean, 50 years) participated in the study. All were fasted overnight (and for 2 h after dosing) and administered 100, 150, 200 or

250 mg/m² daily for 5 days. On day 1, the peak plasma concentration was 7.0 mg/L for the 100 mg/m² dose; 5.84 mg/L for the 150 mg/m² dose; 13.9 mg/L for 200 mg/m² and 13.7 mg/L for 250 mg/m². These concentrations were observed at 0.5, 0.94, 0.94 and 1.0 h, respectively. On day 5, the concentrations were 6.92, 5.71, 13.0 and 12.2 mg/L for the 4 doses at 0.39, 1.17, 1.25 and 1.33 h, respectively.

Fifteen patients were also administered 200 mg/m² daily for 5 days, either in the fasting state (overnight fast and an additional 4 h after dosing), or in the fed state (ate a high-fat breakfast 1 h before dosing). This was repeated every 4 weeks. The peak plasma concentration for those who were administered temozolomide while fasting was 9.55 mg/L at 1.07 h, and for those who were allowed food 6.51 mg/L at 2.25 h [Brada *et al.* 1999].

Advanced cancer patients were administered an oral dose of 250 mg/m² temozolomide daily for 5 consecutive days. On day 1, the peak plasma concentration was 13.7 mg/L observed at 1 h. On day 5, the peak concentration was 12.2 mg/L at 1.33 h. The drug could be quantified in plasma between 0.25 and 12.0 h after dosing [Kim *et al.* 2001].

Toxicity Haematologic toxicity is dose-limiting with values of 1 g/m² and 1.25 g/m² being associated. Myelosuppression and thrombocytopenia are also dose-limiting.

Bioavailability 100%.

Half-life 1.8 h (temozolomide); 2.5 min (MTIC).

Volume of Distribution Apparent, 0.4 L/kg; 17 L/m².

Clearance Systemic clearance, mean, 115 mL/min/m² after a single dose and 102 mL/min/m² after 5 days multiple dosing.

Protein Binding 15%.

Dose Orally, 150 to 200 mg/m² body surface daily for 5 days, repeated every 28 days.

Gas Chromatography System GA—RI 2690 (tenoxicam-Me₂)

High Performance Liquid Chromatography System HX—RI 366; system HAA—retention time 12.7 min.

Column: RP C₁₈ Nucleosil (250 × 4.6 mm, 5 μm). Mobile phase: sodium dihydrogen orthophosphate (10 mmol/L), sodium lauryl sulfate (1 mmol/L) and acetonitrile: water (pH 2.8) (35:65), flow rate 1.5 mL/min. UV detection (λ = 355 nm). IS: ketorolac. Retention time: tenoxicam, 4.6 min; IS, 10.3 min [Mason, Hobbs 1995].

Column: 100 RP-18 Lichrospher (125 × 4 mm i.d., 5 μm). Mobile phase: phosphate buffer (0.1 mol/L, pH 7.4): methanol (3:2), flow rate 1.1 mL/min. UV detection (λ = 335 nm). IS: prioxicam. Retention time: tenoxicam, 3.4 min; IS, 4.5 min [Múnera-Jaramillo, Botero-Garcés 1993].

Ultraviolet Spectrum Aqueous acid—263, 377 nm; basic—263, 289 nm.

Infrared Spectrum Principal peaks at wavenumber 1607, 1325, 1423 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 78, 350, 135, 176, 77, 97, 123, 110 (tenoxicam- Me_2).

Quantification

Plasma HPLC UV detection ($\lambda = 355$ nm). Limit of detection, 0.04 mg/L [Mason, Hobbs 1995]. UV detection ($\lambda = 355$ nm). Limit of detection, 0.005 mg/L [Múnera-Jaramillo, Botero-Garcés 1993]. UV detection ($\lambda = 371$ nm). Limit of detection, 0.02 mg/L [Heizmann *et al.* 1986]. UV detection ($\lambda = 361$ nm). Limit of detection, 0.2 mg/L [Dixon *et al.* 1984]. UV detection ($\lambda = 361$ nm). Limit of detection, 0.05 mg/L [Pickup *et al.* 1981].

Urine HPLC UV detection ($\lambda = 371$ nm). Tenoxicam and hydroxy-metabolites. Limit of detection, 0.05 mg/L [Dell *et al.* 1984].

Disposition in the Body Tenoxicam is rapidly and completely absorbed after oral administration. Peak plasma concentrations occur within about 2 h in fasting subjects, but may be delayed up to 6 h after food, although the extent of absorption is not affected. It is over 98.5% protein bound and penetrates synovial fluid. Tenoxicam is completely metabolised to its inactive metabolites, and about two-thirds of the administered dose is excreted in urine, primarily as the active 5-hydroxypyridyl metabolite. The remainder is excreted in bile as glucuronide

conjugates (glucuronidated 6-*O*-metabolite and glucuronide metabolites of the hydroxy-metabolite). 0.4% of the drug is excreted unchanged in urine. Steady-state concentrations are achieved within 10 to 15 days. The drug is not known to accumulate.

Therapeutic Concentration

After oral administration of 20 mg to 12 healthy subjects, aged between 21 and 52 years, in the fasting state and then following food, mean peak plasma concentrations of 3.0 mg/L and 2.4 mg/L, respectively, were obtained at 1.8 and 5.8 h [Day *et al.* 1987].

Six healthy male volunteers with a mean age of 25.5 years (between 20 and 31 years) were administered with 20 mg tenoxicam after an overnight fast. The mean maximum concentration was 7.66 $\mu\text{mol/L}$ after 1.3 h [Benveniste *et al.* 1990].

Half-life Plasma half-life, 60 to 70 h.

Volume of Distribution 10 to 12 L.

Clearance Plasma, 0.09 to 0.14 L/h.

Protein Binding Over 98.5%.

Note For reviews of tenoxicam, see Gonzalez and Todd [1987] and Todd and Clissold [1991].

For a review of the pharmacokinetics of tenoxicam, see Nilsen [1994].

Terazosin

α_1 -Adrenoceptor Antagonist

$\text{C}_{19}\text{H}_{25}\text{N}_5\text{O}_4 = 387.4$

CAS—63590-64-7

IUPAC Name [4-(4-Amino-6,7-dimethoxyquinazolin-2-yl)piperazin-1-yl]-(oxolan-2-yl)methanone

Synonym 1-(4-Amino-6,7-dimethoxy-2-quinazolinyl)-4-[(tetrahydro-2-furanyl)-carbonyl]-piperazine

Proprietary Names Abbott-45975; Deflox; Flotrin; Heitrin; Hytrin; Hytrinex; Itrin; Magnuroil; Sinalfa; Teraprost; Urodie; Uroflow; Vasocard; Vicard.

Chemical Properties A white, fine crystalline powder with no discernible odour. Mp 272° to 274°. Soluble in water (29.7 g/L), methanol (33.7 g/L), ethanol (4.1 g/L), 0.1 mol/L aqueous hydrochloric acid (3.8 g/L), chloroform (1.2 g/L) and acetone (0.01 g/L); freely soluble in isotonic saline; practically insoluble in hexane. pK_a 7.1 (0.1 mol/L sodium hydroxide). Log *P* (octanol/water), 1.47.

Terazosin Hydrochloride

$\text{C}_{19}\text{H}_{25}\text{N}_5\text{O}_4 \cdot \text{HCl} = 423.9$

CAS—63074-08-8

Chemical Properties Hygroscopic crystals. Mp 278° to 279°. Soluble in water (761.2 g/L).

Terazosin Hydrochloride Dihydrate

$\text{C}_{19}\text{H}_{25}\text{N}_5\text{O}_4 \cdot \text{HCl} \cdot 2\text{H}_2\text{O} = 459.9$

CAS—70024-40-7

Chemical Properties Mp 271° to 274°. Soluble in water (24.2 g/L).

Thin-layer Chromatography Plate: silica gel 60 F₂₅₄. Mobile phase: chloroform:toluene:methanol (9:1:6). Fluorescence detection ($\lambda_{\text{ex}} = 257$ nm; $\lambda_{\text{em}} = 345$ nm). Rf 0.60 [Chang, Bauer 1991].

High Performance Liquid Chromatography System HZ—Retention time 2.2 min.

Column: KR100-5-C₁₈ metaphase (150 × 4 mm i.d., 5 μm); (guard) RP₁₈ Perisorb (30 to 40 μm pellicular). Mobile phase: disodium hydrogen phosphate (0.01 mol/L) : acetonitrile : tetrahydrofuran (76 : 22 : 2) (pH 6.5), flow rate 1 mL/min. IS: prazosin. Fluorescence detection (λ_{ex} = 250 nm; λ_{em} = 370 nm). Retention time: terazosin, 4.1 min; IS, 8.24 min [Cheah *et al.* 2000].

Column: AD Chiralpak (100 × 2.1 mm i.d., 10 μm). Mobile phase: hexane : 2-propanol containing 0.05% diethylamine (65 : 35), flow rate 0.15 mL/min. IS: prazosin. Detection: MS—MS (terazosin, *m/z* → 388.2; IS, *m/z* → 384.2). Retention time: terazosin, 4.8 min; IS, 4.92 min [Zavitsanos, Alebic-Kolbah 1998].

Column: ODS (250 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : acetonitrile : disodiumhydrogen orthophosphate (0.04 mol/L) (22 : 22 : 56), flow rate 1.2 mL/min. IS: prazosin. Fluorescence detection (λ_{ex} = 250 nm; λ_{em} = 370 nm). Retention time: terazosin 3.8 min; IS, 4.9 min [Sekhar *et al.* 1998].

Ultraviolet Spectrum Aqueous solution (water)—212 (A₁¹ = 65.7), 245 (A₁¹ = 127.5), 330 nm (A₁¹ = 24.0); aqueous acid—246, 212, 331 nm; basic—250, 273 nm.

Infrared Spectrum Principal peaks at wavenumber 1594, 1437, 1247 cm⁻¹ (KBr disk).

Mass Spectrum Principal ions at *m/z* 233, 71, 316, 245, 43, 387, 234, 205, 259.

Quantification

Blood HPLC Limit of detection, 1 μg/L [Sekhar *et al.* 1998]. Limit of quantification, 0.0625 μg/L [Zavitsanos, Alebic-Kolbah 1998].

Plasma HPLC Limit of quantification, 0.25 μg/L [Cheah *et al.* 2000].

Disposition in the Body The onset of action occurs after ~15 min and the duration is about 24 h. Terazosin is rapidly and almost completely absorbed from the gastrointestinal tract after oral administration, and is extensively metabolised in the liver to yield piperazine and three other inactive metabolites. Absorption is not affected by the presence of food. The major route of elimination is via the biliary tract, and the drug is excreted in faeces (60%) and urine (40%). 10% is excreted as the parent drug and the remainder as its metabolites. Renal impairment shows no significant effect on pharmacokinetics. The drug displays linear kinetics after oral and IV doses.

Therapeutic Concentration

Young, healthy, male volunteers were administered with 5 mg terazosin and the median peak plasma concentration was 91 μg/L. This was reached after 1 h and decreased to 11 μg/L at around 23.5 h [Taguchi *et al.* 1998].

Bioavailability 90 to 94%.

Half-life 8 to 13 h; increased in the elderly.

Volume of Distribution 15 to 30 L.

Clearance Plasma, 76.3 to 86.6 mL/min (after an 0.5 to 2.0 mg IV dose); decreased in patients with hypertension, 53 to 57 mL/min.

Protein Binding 90 to 95%.

Dose The usual dose is 1 to 3 mg daily but up to 20 mg daily may be administered.

Terbinafine

Antifungal

C₂₁H₂₅N = 291.4

CAS—91161-71-6

IUPAC Name (*E*)-*N*,6,6-Trimethyl-*N*-(naphthalen-1-ylmethyl)hept-2-en-4-yn-1-amine

Synonyms (*E*)-6,6-Dimethylhept-2-en-4-ynyl(methyl)-(1-naphthylmethyl)amine; SF-86-327; SF-86327.

Terbinafine Hydrochloride

C₂₁H₂₅N·HCl = 327.9

CAS—78628-80-5

Proprietary Names *DesenexMax*; *Lamisil*; *Terbinex*.

Chemical Properties A white or almost white powder. Mp 195° to 198°. Very slightly or slightly soluble in water; freely soluble in dehydrated alcohol and in methanol; slightly soluble in acetone. Log *P* (octanol/water), 6.00; see also Oremusova, Vitkova [2007].

Quantification

Plasma HPLC Mobile phase: acetonitrile and 0.012 mol/L TEA : 0.020 mol/L orthophosphoric acid (50 : 50). UV detection (λ = 224 nm). Limit of quantification, 2 μg/L for terbinafine and desmethylterbinafine [Denouel *et al.* 1995]. Column: phenyl column. UV detection (λ = 224 nm). Terbinafine and 5 metabolites [Zehender *et al.* 1995]. UV detection. Limit of detection, 50 μg/L for terbinafine and desmethylterbinafine (ECD), 100 μg/L for carboxyterbinafine [Schatz, Haberl 1989].

LC-MS Column: reversed phase. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 5 μg/L [Dotsikas *et al.* 2007]. ESI, positive ion mode. Limit of quantification, 1 μg/L [de Oliveira *et al.* 2001]. Limit of quantification, 0.0679 μg/L [Brignol *et al.* 2000].

Serum Differential pulse voltammetry Limit of detection, 2.5 × 10⁻⁸ mol/L (25 nmol/L) [Wang *et al.* 2008].

Urine GC Column: fused silica capillary. FID. Limit of detection, for naphthoic acid, 50 μg/L [Schatz, Haberl 1989].

UV detection. Limit of detection, 300 µg/L for terbinafine, desmethylterbinafine, carboxyterbinafine and desmethylcarboxyterbinafine [Schatz, Haberl 1989].

Milk HPLC ECD. Limit of detection, 50 µg/L for terbinafine and 100 µg/L for desmethylterbinafine [Schatz, Haberl 1989].

Sebum HPLC See Plasma [Denouel *et al.* 1995].

Hair LC-MS Column: reversed phase microbore (50 × 1 mm i.d.). Mobile phase: 12.5% formic acid : propan-2-ol (85 : 15). ESI, positive ion mode. Limit of quantification, 10 ng/g [Majumdar *et al.* 2000].

Nail HPLC Terbinafine and its metabolite [Dykes *et al.* 1990]. See Plasma [Denouel *et al.* 1995].

Skin HPLC See Plasma [Denouel *et al.* 1995].

Disposition in the Body Terbinafine is well absorbed from the gastrointestinal tract; bioavailability ~40% as it undergoes first-pass hepatic metabolism. Terbinafine rapidly diffuses through the dermis and is concentrated in the lipophilic stratum corneum. It is secreted in sebum and high levels occur in hair follicles, hair and sebum-rich skin. It is distributed in to the nail plate within the first few weeks of treatment. It is metabolised to inactive metabolites, which are excreted mainly in the urine. The main plasma metabolites are unconjugated carboxy compounds. Approximately 70% of an oral dose is excreted in the urine. Less than 5% of topical dose is absorbed.

Therapeutic Concentration Peak plasma levels of ~1 mg/L terbinafine occur ~2 h after a single oral dose of 250 mg.

In 10 healthy subjects, peak plasma levels of 1.7 mg/L occurred 1.2 h after an oral dose of 250 mg terbinafine. Levels exhibited a triphasic decline, with a terminal deposition half-life of 16.5 days [Kovarik *et al.* 1995].

Maximum plasma levels of 1.656 and 1.552 mg/L, respectively, were obtained in healthy subjects after single doses of 2 different oral formulations of terbinafine [Jiang *et al.* 2008].

In 12 patients treated with 250 mg terbinafine daily for up to 48 weeks, terbinafine was detectable in distal nail clippings after 3–18 weeks. Levels of 0.25–0.55 µg/g in nails were quickly achieved and remained stable [Finlay 1992].

Twenty patients given oral doses of 125 mg daily for 4 weeks had detectable levels in the stratum corneum after 1 week and in some cases peak levels of 247.8 ng/g were reached 1 week after completion of treatment. Levels of 50.73 ng/g were detected at 6 weeks after treatment, but terbinafine was not detected at 8 weeks after treatment [Kikuchi *et al.* 2008a; , 2008b].

Topical application of 1% terbinafine hydrochloride produced levels of 170, 228.5 and 249.2 mg/g in the stratum corneum, 2, 4 and 12 weeks after starting treatment, respectively [Tanuma *et al.* 2000].

Toxicity A few cases of overdose (up to 5 g) have been reported. The main symptoms are headache, nausea, epigastric pain and dizziness. Treatment consists in eliminating the drug, usually with activated charcoal, and symptomatic supportive therapy if required.

Half-life Absorption half-life, ~0.8 h. Plasma elimination half-life, ~17–36 h; terminal elimination half-life, up to 400 h on prolonged oral therapy.

Bioavailability Approximately 40% after oral dosing.

Volume of Distribution 11 L/kg [Hosseini-Yeganeh, McLachlan 2002].

Clearance Reduced by ~50% in renal impairment.

Protein Binding >99%.

Note For other reports of the pharmacokinetics of terbinafine and its metabolites after oral administration, see Humbert *et al.* [1995], Kovarik *et al.* [1992] and Nedelman *et al.* [1996]; for the pharmacokinetics of terbinafine and its metabolites in children, see Abdel-Rahman *et al.* [2005] and Humbert *et al.* [1998].

Terbutaline

Sympathomimetic

C₁₂H₁₉NO₃ = 225.3

CAS—23031-25-6

IUPAC Name 5-[2-(Tert-butylamino)-1-hydroxyethyl]benzene-1,3-diol

Synonym 5-[2-[(1,1-Dimethylethyl)amino]-1-hydroxyethyl]-1,3-benzenediol

Chemical Properties Crystals. Mp 119° to 122°. pK_a 8.7, 10.0, 11.0 (20°).

Terbutaline Sulfate

(C₁₂H₁₉NO₃)₂·H₂SO₄ = 548.6

CAS—23031-32-5

Proprietary Names Aerodur; Arubendol; Asmaline; Asthmoprotect; Ataline; Brethaire; Brethine; Bricalin; Bricanyl; Butaliret; Butalitat; Butylin; Contimit; Dhatalin; Monovent; Taziken; Tedipulmo; Terbasmin; Terbul(in); Terbuturmant; Tolbin; Vacanyl.

Chemical Properties A white to greyish-white crystalline powder. Mp 246° to 248°. Soluble 1 in 4 of water; slightly soluble in ethanol and methanol; practically insoluble in chloroform and ether.

Colour Tests *p*-Dimethylaminobenzaldehyde—orange/violet; Folin-Ciocalteu reagent—blue; Liebermann's reagent—black; Mandelin's test—grey-green; Marquis test—yellow; potassium dichromate (method 1)—brown (slow).

Thin-layer Chromatography System TA—R_f 0.47; system TB—R_f 0.01; system TC—R_f 0.01; system TE—R_f 0.21; system TL—R_f 0.05; system TAE—R_f 0.18; system TAF—R_f 0.77; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.29 (acidified potassium permanganate solution, strong reaction).

High Performance Liquid Chromatography System HA—*k* 0.9; system HAA—retention time 3.7 min; system HX—RI 225.

Ultraviolet Spectrum Aqueous acid—276 nm (A₁¹=85a); aqueous alkali—297 nm (A₁¹=150b).

Infrared Spectrum Principal peaks at wavenumbers 1210, 1231, 1155, 1069, 1610, 1042 cm⁻¹ (terbutaline sulfate, KBr disk).

Mass Spectrum Principal ions at m/z 30, 86, 57, 41, 29, 39, 192, 42.

Quantification

Plasma GC-MS Unconjugated terbutaline. Limit of detection, 100 ng/L [Jacobsson *et al.* 1980]. Unconjugated and total terbutaline. Limit of detection, 300 ng/L [Clare *et al.* 1979].

HPLC Fluorescence detection. Terbutaline enantiomers. Limit of detection, 1 µg/L [Kim *et al.* 2000]. Fluorescence detection. Limit of detection, 2.5 µg/L [McCarthy *et al.* 1993]. Electrochemical detection. Limit of detection, 0.8 to 1 µg/L [Sagar *et al.* 1992; 1993; Herring, Johnson 2000]. Electrochemical detection. Limit of detection about, 1 µg/L [Bergquist, Edholm 1983].

Urine GC-MS See Blood [Black, Hansson 1999]. See Plasma [Clare *et al.* 1979].

HPLC Fluorescence detection. Terbutaline enantiomers. Limit of detection, 0.3 µg/L [Kim *et al.* 2001].

Postmortem tissues GC-MS Unconjugated terbutaline. Limit of detection, 1.5 ng/g [Leferink *et al.* 1978].

Disposition in the Body Terbutaline is incompletely absorbed after oral administration. Extensive first-pass metabolism occurs in the liver and gut wall to produce the sulfate conjugate (the main metabolite) but some glucuronic acid conjugation also occurs. <15% of an oral dose is present as free drug in the plasma. It is excreted in the urine as unchanged drug and the inactive conjugates, the concentration of each being dependent upon the route of administration. After oral administration, up to about 50% of a dose is excreted in the urine, predominantly as the sulfate conjugate, with up to 10% as unchanged drug. Up to about 60% of a dose is eliminated in the faeces, mainly in unchanged form. After IV or SC administration, more than 80% of a dose is excreted in the urine, with up to about 60% as unchanged drug and only about 2 to 3% is eliminated in the faeces.

Therapeutic Concentration

After single oral doses of 5 mg to 8 subjects, peak serum concentrations of 0.002 to 0.005 (mean, 0.003) mg/L were attained in 2 to 4 h. In 3 subjects there were 2 peaks; the first occurred in 1 to 2 h and the second in 3 to 4 h. After single subcutaneous doses of 0.5 mg to the same subjects, peak serum concentrations of 0.005 to 0.011 (mean, 0.007) mg/L were attained in 0.2 to 0.6 h [Leferink *et al.* 1982].

Toxicity

A female subject took several tablets of terbutaline during a severe night attack of asthma and died the next morning. The following postmortem tissue concentrations were reported: serum 0.014 mg/L, heart 0.036 µg/g, kidney 0.054 µg/g, liver 0.055 µg/g, lung 0.026 µg/g, muscle 0.063 µg/g [Leferink *et al.* 1978].

Approximately 6 h after taking 500 mg of terbutaline, a 22-year-old woman presented with a plasma concentration of 0.2 mg/L, about 50 times the normal therapeutic concentration, which fell to therapeutic levels within 36 h [Heath, Hultén 1987].

Half-life Plasma half-life, about 3 to 4 h.

Volume of Distribution About 1 L/kg.

Clearance Plasma clearance, about 4 mL/min/kg.

Protein Binding About 15 to 25%.

Dose 10 to 15 mg of terbutaline sulfate daily.

Terbutryne

Herbicide

$C_{10}H_{19}N_5S = 241.4$

CAS—886-50-0

IUPAC Name 2-N-Tert-butyl-4-N-ethyl-6-methylsulfanyl-1,3,5-triazine-2,4-diamine

Synonyms Terbutryn; 2-tert-Butylamino-4-ethylamino-6-methylthio-1,3,5-triazine.

Proprietary Names Clarosan; Prebane. It is an ingredient of Opogard.

Chemical Properties A white crystalline powder. Mp 104°. Practically insoluble in water; readily soluble in chloroform, ether and methanol. pK_a 4.3. Log P (octanol/water), 3.7.

Thin-layer Chromatography System TA— R_f 0.77; system TX— R_f 0.32; system TY— R_f 0.32; system TAB— R_f 0.07; system TAC— R_f 0.12 (Dragendorff spray, positive).

Gas Chromatography System GA—RI 1940; system GK—RRT 0.99 (relative to caffeine).

High Performance Liquid Chromatography System HY—RI 442; system HAO— k 12.09; system HAP— k 1.68.

Ultraviolet Spectrum

Infrared Spectrum Principal peaks at wavenumbers 1520, 1587, 1215, 806, 1266, 1133 cm^{-1} (KBr disk).

Terbutylazine

Herbicide

$C_9H_{16}ClN_5 = 229.7$

CAS—5915-41-3

IUPAC Name 2-N-Tert-butyl-6-chloro-4-N-ethyl-1,3,5-triazine-2,4-diamine

Synonyms 6-Chloro-N-(1,1-dimethylethyl)-N'-ethyl-1,3,5-triazine-2,4-diamine; diethylterbutylazine; GS-13529; terbutylazine.

Proprietary Names Gardoprim; Primatol M; Sorgoprim.

Chemical Properties A colourless powder/white solid. Mp 177° to 179°. Soluble in water (8.5 mg/L at 20°), dimethylformamide (100 mg/L at 20°), ethyl

acetate (40 g/L at 20°), isopropanol (10 g/L at 20°), tetralin (10 g/L at 20°), xylene (10 g/L at 20°) and octanol (14.3 g/L at 20°). pK_a 2.0. Log *P* (octanol/water), 3.21.

Gas Chromatography System GA—RI 1805.

Ultraviolet Spectrum

Mass Spectrometry Principal ions at *m/z* 214, 173, 216, 229, 132, 68, 138, 175.

Disposition in the Body Terbutylazine is excreted in urine and faeces, ~85% of a dose is excreted within the first 24 h.

Terodiline

Calcium Antagonist, Antimuscarinic

$C_{20}H_{27}N = 281.4$

CAS—15793-40-5

IUPAC Name *N*-(1,1-Dimethylethyl)- α -methyl- γ -phenylbenzenepropanamine

Chemical Properties Yellow liquid. Bp 130° to 132°. Slightly soluble in water (7.9 mg/L). Log *P* (octanol/water) 5.42 [Meylan, Howard 1995].

Terodiline Hydrochloride

$C_{20}H_{27}N.HCl = 317.9$

CAS—7082-21-5

Proprietary Names *Mictrol*; *Micturin*.

Thin-layer Chromatography System TA— R_f 52; system TB— R_f 62; system TC— R_f 19; system TE— R_f 80; system TL— R_f 26; system TAE— R_f 18.

Gas Chromatography System GA—RI 1919.

High Performance Liquid Chromatography Column: Inertsil ODS (150 \times 4.6 mm i.d., 5 μ m). Mobile phase: acetonitrile : 0.01 mol/L phosphate buffer (pH 3.5; 38 : 62) containing 0.6% nonylamine. UV detection ($\lambda = 200$ nm). Limit of quantification not reported [Ogiso *et al.* 1995].

Mass Spectrum Principal ions at *m/z* 44, 100, 167, 266, 281.

Quantification

Blood GC Column: DB-1 (30 m \times 0.32 mm i.d., 0.25 μ m). Carrier gas: He, 22 cm/s. Temperature programme: 100° to 280° at 8°/min. NPD. Retention time: 14.9 min. Limit of quantification, 100 μ mol/L [Hattori *et al.* 1992].

GC-MS Column: HP-1 methylsilicone (12 m). Carrier gas: He, 1 mL/min. Temperature programme: 45° for 1.5 min to 300° at 10°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification not reported [Cattini *et al.* 1989].

Serum GC-MS Column: methylsilicon (25 m \times 0.32 mm, 0.11 μ m). Carrier gas: He, 0.9 mL/min. Temperature programme: 85° for 1 min to 300° at 40°/min for

10 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 1 μ g/L [Hallen *et al.* 1994].

Urine GC Column: DB-1 (30 m \times 0.32 mm i.d., 0.25 μ m). Carrier gas: He, 22 cm/s. Temperature programme: 100° to 280° at 8°/min. NPD. Retention time: 14.9 min. Limit of quantification, 100 μ mol/L [Hattori *et al.* 1992].

GC-MS Column: methylsilicone (25 m \times 0.32 mm, 0.11 μ m). Carrier gas: He, 0.9 mL/min. Temperature programme: 85° for 1 min to 300° at 40°/min for 10 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 1 μ g/L [Hallen *et al.* 1994]. Column: HP-1 methylsilicone (12 m). Carrier gas: He, 1 mL/min. Temperature programme: 45° for 1.5 min to 300° at 10°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification not reported [Cattini *et al.* 1989].

Faeces GC-MS Column: methylsilicon (25 m \times 0.32 mm, 0.11 μ m). Carrier gas: He, 0.9 mL/min. Temperature programme: 85° for 1 min to 300° at 40°/min for 10 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 1 μ g/L [Hallen *et al.* 1994].

Disposition in the Body Rapidly and completely absorbed from the gastrointestinal tract with peak plasma concentrations reached within 4 h. It is extensively metabolised with only 15% of an oral dose recovered as unchanged drug. Hydroxylation of the aromatic rings is the major metabolic pathway, followed by glucuronic acid conjugation. Approximately 75% of an oral dose is recovered in the urine as conjugates, and 25% in faeces. Unchanged terodiline in faeces accounts for about 1% of a dose. Metabolites include *p*-hydroxyterodiline which is the major active metabolite and 3,4-dihydroxyterodiline.

Therapeutic Concentration

Eight healthy volunteers were administered either racemic terodiline hydrochloride (200 mg, 88.5 mg free base for each enantiomer), *R* (+)-terodiline (88.5 mg free base) or *S*(-)-terodiline (65.4 mg free base), as oral doses. Peak plasma concentrations were as shown below.

	<i>R</i> (+)-Terodiline		<i>S</i> (-)-Terodiline	
	<i>C</i> _{max} (μ g/L)	Time (h)	<i>C</i> _{max} (μ g/L)	Time (h)
Racemic dose	324	3.3	260	3.3
Individual enantiomers	260	3.0	179	3.4

^a[Hartigan-Go *et al.* 1996].

Two groups of geriatric patients (mean age, 82 years) were administered either a single 25 mg oral dose of terodiline (Group A) or repeated doses of 12.5 mg twice-daily for 6 weeks (Group B). The mean peak serum concentration for Group A was 110 μ g/L after 4 h. A steady-state serum concentration of 642 μ g/L was reached for Group B. When compared with healthy young volunteers a difference in various pharmacokinetic parameters was observed: Group A had higher serum terodiline concentrations, increased half-life, lower renal clearance and lower total clearance [Hallen *et al.* 1988].

Toxicity

A 20-year-old male was found dead after taking several terodiline tablets (at least 10, 12.5 mg tablets). Blood and urine terodiline concentrations were found to be 20 mg/L and 108 mg/L, respectively [Cattini *et al.* 1989].

In 1991, the manufacturer withdrew terodiline from all countries because of its association with cardiac arrhythmias.

Bioavailability \approx 92%.

Half-life 60 h.

Volume of Distribution Apparent, 479 L (range 260 to 886 L).

Clearance Total (from serum) 4.5 to 4.8 L/h; renal 0.66 L/h.

Protein Binding \approx 85%.

Dose Up to 25 mg daily, orally.

Tertatolol

β -Blocker, Antihypertensive

$C_{16}H_{25}NO_2S = 295.4$

CAS—34784-64-0

IUPAC Name 1-(tert-butylamino)-3-(3,4-dihydro-2H-thiochromen-8-yl)oxypropan-2-ol

Synonym 1-[(3,4-Dihydro-2H-1-benzothioopyran-8-yl)oxy]-3-[(1,1-dimethyl-ethyl)-amino]-2-propanol

Chemical Properties Mp 180° to 183° pK_a 9.8. Log P (octanol/water), 2.5 (pH 7, 24°). Extraction yield, 1 [Demme *et al.* 2005].

Tertatolol Hydrochloride

C₁₆H₂₅NO₂S.HCl = 331.9

CAS—33580-30-2

Proprietary Names Artex; Artexal; Prenalex.

Chemical Properties White crystals. Mp 180° to 183°. Freely soluble in aqueous solution and alcohol, and has high lipid solubility.

Thin-layer Chromatography System TB—R_f 0.13; system TE—R_f 0.43; system TF—R_f 0.01; system TAE—R_f 0.17.

Gas Chromatography System GA—RI 2310.

Column: 3% SE-30 on 100-120 mesh Chromosorb W AW DMCS (glass, 2.1 m x 2 mm i.d.). Column temperature: oven, 260°. Carrier gas: helium, flow rate 20 mL/min. MS detection (SIM at *m/z* 368 for tertatolol; 456 for IS). IS: 4-hydroxytertatolol. Retention time: tertatolol, 2.13 min; IS, 2.92 min [Efthymiopoulos *et al.* 1987].

High Performance Liquid Chromatography System HX—RI 381.

Column: XLODS Ultrasphere (70 x 4.6 mm i.d., 3 μm). Mobile phase: acetonitrile: water (40:60), flow rate 2 mL/min. IS: (-)-alprenolol. Fluorescence detection (λ_{ex}=220 nm; λ_{em}=320 nm). Retention time: (-)-tertatozol, 15 min; (+)-tertatozol, 17 min; IS, 12.5 min [Lave *et al.* 1991].

Ultraviolet Spectrum

Mass Spectrum Principal ions at *m/z* 86, 166, 251, 280, 57, 151, 70, 165.

Quantification

Blood HPLC Limit of quantification, 6 μg/L [Lave *et al.* 1991].

Urine GC-MS Limit of detection, 1 μg/L [Efthymiopoulos *et al.* 1987].

HPLC See Blood [Lave *et al.* 1991].

Disposition in the Body Tertatolol is rapidly and almost completely absorbed, and peak plasma levels are reached within 1 to 2 h after administration. First-pass hepatic metabolism is low and there is limited extravascular distribution. There are linear pharmacokinetics in the dose range of 1 to 10 mg. The three main metabolic routes are sulfoxidation, hydroxylation and conjugation. Inactive metabolites make up 70% of urine excretion. 4-OH-tertatozol is the active metabolite and makes up <10% of urine. Repeated dose results in no change in the pharmacokinetics and there is no change in pharmacokinetics in the elderly or renal impaired. Steady state is achieved from first administration without accumulation.

Therapeutic Concentration

Twenty-two hypertensive patients (12 men and 10 women) with a mean age of 52.6 years and chronic renal failure were used in the study. The patients were orally administered 5 mg tertatolol daily for 4 weeks. The mean peak concentration of the drug was 160 μg/L observed at 1.2 h [Rainfray *et al.* 1989].

Ten patients, with cirrhosis and oesophageal varices, were administered with 2.5 mg tertatolol orally and 1.25 mg IV. The mean peak plasma concentration was 70 μg/L at 0.75 h [Cales *et al.* 1993].

Toxicity High therapeutic safety index; 3800 to 13 000 higher than human clinical dose.

Bioavailability 60% after oral administration.

Half-life 3 h.

Volume of Distribution 30 to 40 L (0.7 L/kg); increased to 50 L in patients with cirrhosis.

Clearance Plasma clearance, 130 mL/min; decreased to 49 mL/min in patients with cirrhosis. Systemic clearance, 0.1 L/h.

Protein Binding 95% to mainly α₁-glycoprotein; 85% in patients with cirrhosis.
Dose 5 mg daily.

Cales P *et al.* (1993). Hemodynamic and pharmacokinetic study of tertatolol in patients with alcoholic cirrhosis and portal hypertension. *J Hepatol* 19(1): 43–50.

Testosterone

Androgen

C₁₉H₂₈O₂ = 288.4

CAS—58-22-0

IUPAC Name (8R,9S,10R,13S,14S,17S)-17-Hydroxy-10,13-dimethyl-1,2,6,7,8,9,11,12,14,15,16,17-dodecahydrocyclopenta[a]phenanthren-3-one

Synonyms 17β-Hydroxyandrost-4-en-3-one; 17-hydroxy-10,13-dimethyl-1,2,6,7,8,9,11,12,14,15,16,17-dodecahydrocyclopenta[a]phenanthren-3-one.

Proprietary Names Androderm; Andrologel; Andropatch; Atmos; Histerone; Hydrotect; Malogen Aqueous; Oreton; Tesamone; Testandro; Testoderm; Testopel; Testotop; Testozard.

Chemical Properties White or creamy-white crystals or crystalline powder. Mp 152° to 157°. Practically insoluble in water; soluble 1 in 6 of dehydrated alcohol, 1 in 2 of chloroform and 1 in 100 of ether. Log P (octanol/water), 3.3.

Testosterone Cypionate

C₂₇H₄₀O₃ = 412.6

CAS—58-20-8

Synonyms Testosterone cyclopentylpropionate; testosterone cypionate.

Proprietary Names Andronate; depAndro; Depotesteron; Duratec; Pertestis; Testex; Testiormina; Virilon.

Chemical Properties A white or creamy-white crystalline powder. Mp 101° to 102°. Insoluble in water; freely soluble in ethanol, chloroform and ether.

Testosterone Enanthate

C₂₆H₄₀O₃ = 400.6

CAS—315-37-7

Synonyms Testosterone enanthate; testosterone heptanoate; testosterone oenanthate.

Proprietary Names Andro; Andropository; Androtardyl; Delatestyl; Durathate Everone; Malogen LA; Malogex; Primoteston-Depot; Testate; Testo-Enant; Testone LA; Testostroval-PA; Testoviron-Depot.

Chemical Properties A white or creamy-white crystalline powder. Mp 36° to 38°. Practically insoluble in water; soluble 1 in 0.3 of ethanol, chloroform and ether.

Testosterone Isocaproate

C₂₅H₃₈O₃ = 386.6

CAS—15262-86-9

Synonym Testosterone isohexanoate

Proprietary Names It is an ingredient of Durateston, Estandron P, Mixogen, Sostanon and Sustanon.

Chemical Properties White to creamy-white crystals or crystalline powder. Mp about 80°. Practically insoluble in water; very soluble in ethanol and chloroform.

Testosterone Phenylpropionate

C₂₈H₃₆O₃ = 420.6

CAS—1255-49-8

Proprietary Names It is an ingredient of Durateston, Estandron P, Mixogen, Sostanon and Sustanon.

Chemical Properties A white crystalline powder. Mp 114° to 117°. Practically insoluble in water; soluble 1 in 40 of ethanol.

Testosterone Propionate

C₂₂H₃₂O₃ = 344.5

CAS—57-85-2

Proprietary Names Malogen in Oil; Testoviron; Tesurene; Virormone. It is an ingredient of Durateston, Estandron P, Mixogen, Sostanon and Sustanon.

Chemical Properties Colourless or yellowish-white crystals or a white or creamy-white crystalline powder. Mp 118° to 122°. Practically insoluble in water; soluble 1 in 6 of ethanol and 1 in 4 of acetone; very soluble in chloroform; freely soluble in ether and in methanol.

Testosterone UndecylateC₂₉H₄₈O₃ = 444.7

CAS—5949-44-0

Synonym Testosterone undecanoate**Proprietary Names** *Andriol; Androxon; Panteston(e); Restanol; Undestor.***Colour Tests** Naphthol-sulfuric acid—yellow/green, brown dichroism; sulfuric acid—no initial colour (green fluorescence under ultraviolet light).**Thin-layer Chromatography** Testosterone: system TB—R_f 0.14; system TE—R_f 0.70; system TF—R_f 0.45; system TP—R_f 0.60; system TQ—R_f 0.07; system TR—R_f 0.90; system TS—R_f 0.63; system TAE—R_f 0.85; system TAF—R_f 0.88; system TAJ—R_f 0.59; system TAK—R_f 0.63; system TAL—R_f 0.92; system TAM—R_f 0.92. CAS—58-46-8

IUPAC Name 9,10-Dimethoxy-3-(2-methylpropyl)-1,3,4,6,7,11b-hexahydrobenzo[a]quinolinizin-2-one**Synonyms** 9,10-Dimethoxy-3-(2-methylpropyl)-1,3,4,6,7,11b-hexahydropryrido[2,1-a]isoquinolin-2-one; 1,3,4,6,7,11b-hexahydro-9,10-dimethoxy-3-(2-methylpropyl)-2H-benzo[a]quinolinizin-2-one; TBZ.**Proprietary Names** *Nitoman; Xenazine.***Chemical Properties** A white crystalline powder. Mp 125° to 128°. Soluble in hot water, ethanol and chloroform. Log P (octanol/water) 2.7.**Colour Tests** Liebermann's reagent—black; Mandelin's test—brown; Marquis test—yellow.**Thin-layer Chromatography** System TA—R_f 0.69; system TB—R_f 0.41; system TC—R_f 0.78; system TE—R_f 0.79; system TL—R_f 0.67; system TAE—R_f 0.80; system TAJ—R_f 0.83; system TAK—R_f 0.33; system TAL—R_f 0.97 (acidified iodoplatinate solution, positive).**Gas Chromatography** System GA—tetrabenazine RI 2490; M (O-desmethyl-OH-) RI 2500; system GB—tetrabenazine RI 2579; M (O-desmethyl-OH-) RI 2638.**High Performance Liquid Chromatography** System HZ—retention time 4.4 min.

Ultraviolet Spectrum Aqueous acid—282 nm ($A_1^1=108a$). No alkaline shift.

Infrared Spectrum Principal peaks at wavenumbers 1694, 1260, 1520, 1155, 1140, 1222 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 191, 261, 274, 260, 316, 192, 190, 176.

Quantification

Plasma HPLC Fluorescence detection. Tetrabenazine and 2-hydroxy metabolite. Limits of detection, 100 to 500 ng/L and 1 to 2 $\mu\text{g/L}$, respectively [Roberts *et al.* 1981; Mehvar *et al.* 1986].

Disposition in the Body Absorbed after oral administration. It is extensively metabolised and excreted in the urine as free and conjugated metabolites; 9 metabolites have been identified in the urine. 2-Hydroxytetrabenazine is an active metabolite.

Therapeutic Concentration

Following a single oral dose of 50 mg to 1 subject, peak plasma concentrations of about 0.015 mg/L of tetrabenazine and 0.085 mg/L of the 2-hydroxy metabolite were attained in 1 and 2 h, respectively [Roberts *et al.* 1981].

Dose 75 to 200 mg daily.

Mehvar R *et al.* (1986). Direct injection high-performance liquid chromatography of tetrabenazine and its metabolite in plasma of humans and rats. *J Pharm Sci* 75: 1006–1009.

Tetracaine

Anaesthetic (Local)

$\text{C}_{15}\text{H}_{24}\text{N}_2\text{O}_2 = 264.4$

CAS—94-24-6

IUPAC Name 2-Dimethylaminoethyl 4-(butylamino)benzoate

Synonyms Amethocaine; 4-(butylamino)benzoic acid 2-(dimethylamino)ethyl ester.

Proprietary Names *Ametop*; *Anesteseico*; *Pontocaine*. It is an ingredient of *Stypto-Caine*.

Chemical Properties A white or light yellow, waxy solid. Mp 41° to 46°. Very slightly soluble in water; soluble 1 in 5 of ethanol, 1 in 2 of chloroform and 1 in 2 of ether. $\text{p}K_a$ 8.2. Log *P* (octanol/water), 3.5.

Tetracaine Hydrochloride

$\text{C}_{15}\text{H}_{24}\text{N}_2\text{O}_2 \cdot \text{HCl} = 300.8$

CAS—136-47-0

Synonyms Butethanol; dicainum.

Proprietary Names *Ametop*; *Anesteseico*; *Anethaine*; *Cepacol Viractin*; *Covostet*; *Hemonet*; *Pontocaine*. It is an ingredient of *Anestesiol*; *Anevrage*; *Cetacaine*; *Dynexan*; *Eludril (spray)*; *Herviros*; *Hexomedine*; *Neocones*; *Osmogenol*.

Chemical Properties A white, hygroscopic, crystalline powder. Mp 148°. 134° to 147°. Soluble 1 in 7.5 of water, 1 in 40 of ethanol and 1 in 30 of chloroform; practically insoluble in acetone, benzene and ether.

Colour Tests Aromaticity (method 2)—yellow/red; Liebermann's test (100°)—blue.

Thin-layer Chromatography System TA— R_f 0.57; system TB— R_f 0.15; system TC— R_f 0.32; system TE— R_f 0.64; system TL— R_f 0.16; system TAE— R_f 0.43; system TAF— R_f 0.39; system TAJ— R_f 0.12; system TAK— R_f 0.00; system TAL— R_f 0.25 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).

Gas Chromatography System GA—tetracaine RI 2220, 4-aminobenzoic acid RI 1547; system GF—RI 2715; system GQ—retention time 8.0 min.

Gas Chromatography-Mass Spectrometry

Column: HP-1 100% dimethylpolysiloxane (12 m \times 0.2 mm i.d., 0.33 μm). Column temperature: 100° held for 2 min, ramp to 300° at 20°/min, held for 1 min. Injector temperature: 280°. Carrier gas: He, flow rate 1 mL/min. SIM acquisition mode. Retention time 8.7 min [Kudo *et al.* 2001].

Column: methylsilicone fused-silica wide-bore DB-1 (15 m \times 0.53 mm i.d., 1.0 μm). Column temperature: 60° to 220° at 8°/min. Injector temperature: 250°. Carrier gas: He, 15 mL/min. NPD [Terada *et al.* 1996].

High Performance Liquid Chromatography System HA— k 2.0; system HQ— k 16.25; system HR— k 1.33; system HX—RI 389; system HY—RI 321; system HZ—retention time 4.4 min; system HAX—retention time 10.8 min; system HAY—retention time 5.4 min.

Column: C_{18} $\mu\text{Bondapak}$ (300 \times 4 mm i.d., 10 μm). Mobile phase: water : acetonitrile : methanol (60 : 20 : 20) containing 0.06% sulfuric acid, 0.5% sodium sulfate, 0.02% sodium heptane sulfonate, pH 2.6. Flow rate, 2 mL/min. UV detection ($\lambda=305$ nm). Retention time 6.0 min [Menon and Norris 1981].

Ultraviolet Spectrum Aqueous acid—229 ($A_1^1=561a$), 281, 312 nm; aqueous alkali—227, 303 nm.

Infrared Spectrum Principal peaks at wavenumbers 1600, 1286, 1174, 1688, 1126, 1532 cm^{-1} (tetracaine hydrochloride, KBr disk).

Mass Spectrum Principal ions at m/z 58, 71, 150, 176, 72, 193, 105, 59 (no peaks above 200); 137, 120, 92, 65, 39, 138, 121, 63 (4-aminobenzoic acid).

Quantification

Blood GC-MS Tetracaine and its metabolites [Kudo *et al.* 2001]. Tetracaine and 4-butylaminobenzoic acid. Limit of detection, 10 ng/g [Hino *et al.* 2000].

Plasma GC-MS (SIM, m/z 58). Limit of quantification, 100 µg/L, limit of detection, 80 µg/L [Ohshima, Takayasu 1999].

HPLC Multiwavelength detection. Tetracaine, *p*-butylaminobenzoic acid, and mepivacaine. Limit of detection, 50 µg/L for tetracaine and *p*-butylaminobenzoic acid [Murtaza *et al.* 2001]. Tetracaine and *p*-*n*-butylaminobenzoic acid [Mazumdar *et al.* 1991].

Serum GC NPD. Tetracaine and other local anaesthetics. Limit of quantification, 24 µg/L [Terada *et al.* 1996].

Urine GC-MS See Plasma [Ohshima, Takayasu 1999].

Biological Samples GC NSD. Tetracaine and other local anaesthetics [Lau *et al.* 1991].

Tissues GC-MS see Blood. Limit of detection, 0.6 ng/g [Hino *et al.* 2000].

HPLC Limit of detection, 0.4 g/L for tetracaine, 0.003 g/L for *p*-*n*-butylaminobenzoic acid [Menon, Norris 1981].

Disposition in the Body Tetracaine is rapidly hydrolysed in the blood to 4-aminobenzoic acid by plasma pseudocholinesterase; it is completely metabolised within 1 h of injection. It can rarely be isolated from blood even within a few minutes of administration. Metabolites are excreted mainly by kidneys. The maximum amount that may be safely administered by injection is probably 50 mg.

Therapeutic Concentration

Following intraspinal administration of 8–14 mg of tetracaine to 10 patients, no trace of tetracaine was revealed in the blood, but mean concentrations of the metabolite, 4-aminobenzoic acid, at 1, 2 and 6 h after injection were 126.5, 97.9 and 43.3 µg/L respectively [Kudo *et al.* 2001].

Dose 5 to 20 mg of tetracaine hydrochloride (0.5% solution) is injected for spinal anaesthesia; 0.5 to 2% solutions have been used for surface anaesthesia.

Tetrachloroethane

Solvent

$C_2H_2Cl_4 = 167.8$

CAS—79-34-5

IUPAC Name 1,1,2,2-Tetrachloroethane

Synonym Acetylene tetrachloride

Chemical Properties A clear, colourless, heavy, non-flammable, mobile liquid. Wt per mL 1.590 to 1.595 g. Mp 44°. Bp 146°. Refractive index, at 25°, 1.4918. Soluble 1 in 350 of water; miscible with ethanol, chloroform and ether. Log *P* (octanol/water), 2.4.

Gas Chromatography System GA—RI 910; system GI—retention time 24.9 min.

Disposition in the Body Tetrachloroethane is absorbed from the gastrointestinal tract, lungs, and through the skin.

Toxicity Tetrachloroethane is probably the most toxic of the chlorinated hydrocarbons. The estimated lethal dose is 3 mL.

Tetrachloroethylene

Anthelmintic, Solvent

$C_2Cl_4 = 165.8$

CAS—127-18-4

IUPAC Name 1,1,2,2-Tetrachloroethene

Synonyms Ethylene tetrachloride; perchloroethylene; tetrachloroethene.

Proprietary names *Ankilostin; Didakene; Nema; Perclene; Tetracap; Tretropil.*

Chemical Properties A colourless, heavy, non-inflammable, mobile liquid. Weight (g/mL) 1.620 to 1.626. Fp -22°. Bp 121°. Tetrachloroethylene (B.P.) contains thymol 0.01% as a preservative. Practically insoluble in water; soluble in ethanol; miscible with chloroform and ether. Log *P* (octanol/water), 3.4.

Colour Test Tetrachloroethylene may be distinguished from carbon tetrachloride and chloroform by the following test: to 5 mL in a stoppered cylinder add 5 mL of bromine solution and shake vigorously at intervals of 15 min for 1 h. The bromine colour fades and there is a white turbidity in the lower layer.

Gas Chromatography System GA—RI 789; system GI—RT 24.3 min; system GAA—RI 811.

Ultraviolet Spectrum

Mass Spectrum Principal ions at m/z 166, 164, 129, 131, 168, 94, 133, 96.

Quantification

Blood GC Column: SPB-1 100% polydimethylsiloxane (30 m × 0.25 mm i.d.). Carrier gas: N₂, 3 mL/min. Temperature programme: 60° for 1 min to 130° at 10°/min for 1.5 min. Retention time: 7.72 min. Limit of detection, 3 ng/g [Dehon *et al.* 2000]. Column: 5% Carbowax on 60/80 mesh Carbopack B (6ft × 0.125 in i.d.). Carrier gas: CH₄:Ar (10:90), 30 mL/min. Temperature: 110°. ECD. Retention time: 6.02 min. [Isenschmid *et al.* 1998]. Column: 10% OV-1 on 80/100 mesh GasChrom Q (0.9 m × 2 mm i.d.). Carrier gas: CH₄:Ar (10:90), 30 mL/min. Temperature: 100°. ECD. Limit of detection not reported [Levine *et al.* 1981]

GC-MS Column: SE-30 vitreous silica capillary (25 m × 0.2 mm i.d.). Temperature: 90°. ECD. Limit of detection, <0.03 μmol/L [Pekari, Aitio 1985]. Column: 3% OV-1 on 80/100 mesh chromosorb WHP (6ft × 0.25 in i.d.). Carrier gas: He. EI ionisation, SIM acquisition mode. Limit of detection not reported [Lukaszewski 1979].

Lung GC See Blood [Isenschmid *et al.* 1998; Levine *et al.* 1981].

GC-MS See Blood [Lukaszewski 1979].

Muscle GC See Blood [Dehon *et al.* 2000].

Disposition in the Body Tetrachloroethylene is slightly absorbed from the gastro-intestinal tract and through the skin, and well absorbed from the lungs. It has an affinity for lipid-rich tissues from which it is slowly released. Approximately 25% of an inhaled dose is excreted unchanged in expired air in 40 h and this is thought to be the major route of excretion; small amounts are eliminated through the skin. Less than ~3% of a dose is metabolised and excreted in the urine, partly as trichloroacetic acid, in 3 days.

Toxicity The maximum permissible atmospheric concentration is 100 ppm. Exposure to air concentrations of more than 1000 ppm may cause unconsciousness within a short time.

A 45-year-old woman was found unconscious. Despite treatment she died on the seventh day of hospitalisation. On the second hospital day, the tetrachloroethylene concentration in blood was 1.32 mg/L [Dehon *et al.* 2000].

A 26-year-old individual was found dead at work. Tetrachloroethylene concentrations were 62 mg/L in blood, 341 mg/kg in liver and 47 mg/kg in lung [Isenschmid *et al.* 1998].

Postmortem tissue concentrations in a 2-year-old child accidentally fatally exposed to tetrachloroethylene vapour were as follows: blood 66 mg/L, urine 0.3 mg/L (also expressed as 1.7 mg/L trichloroethanol and 0.9 mg/L trichloroacetic acid, to which trichloroethylene is metabolised), brain 79.9 μg/g, lungs 46 μg/g [Gaillard *et al.* 1995].

A 53-year-old man was found dead after exposure to tetrachloroethylene vapour. The following postmortem concentrations were reported: blood 4.5 mg/L, brain 69 μg/g, kidney 71 μg/g, liver 240 μg/g and lung 30 μg/g [Levine *et al.* 1981].

In a case of fatal exposure to tetrachloroethylene vapour, a 33-year-old man had the following postmortem concentrations: blood 44 mg/L, brain 360 μg/g and lung 3 g/g [Lukaszewski 1979].

Half-life ≈72 h.

Dose Usually 0.1 mL/kg, to a maximum of 5 mL, as a single dose.

Tetracosactrin

Corticotrophic Peptide

C₁₃₆H₂₁₀N₄₀O₃₁S = 2933.5

Synonyms Ciba 30,920; cosyntropin; synthetic β_{1–24} corticotropin; tetracosactide.

Chemical Properties Synthetic polypeptide identical with the first 24 of the 39 amino-acids of corticotrophin.

Tetracosactrin Acetate

Synonym Tetracosactrin hexa-acetate

Proprietary Names *Cortosyn*; *Synacthen*.

Chemical Properties White crystalline powder. Soluble 1 in 70 of water.

Colour Tests Ammonium molybdate test—blue (limit of detection, 1.0 μg); Vitali's test—pale yellow/pale yellow/orange (limit of detection, 1.0 μg).

Thin-layer Chromatography System T1—R_f 0.00 (location reagent acidified iodoplatinate spray, positive reaction).

Ultraviolet Spectrum 0.1 N hydrochloric acid, maximum at 275 nm.

Disposition in the Body Tetracosactrin is inactivated if administered orally. After IV administration the plasma half-life was about 7 min [Wolf *et al.* 1965].

IV administration produces a rapid rise in plasma hydrocortisone; after IM administration blood hydrocortisone concentrations reach a peak within 1 h and are raised for ≈4 h. Subcutaneous or IM injection of the long-acting depot preparations produce peak blood hydrocortisone concentrations in 8 h with raised values for 24 to 48 h.

Toxicity Allergic reactions, including pruritus and flushing, have been reported, but are much less common than with corticotrophin. Depot preparations produce a prolonged rise in blood corticosteroid concentrations and may lead to Cushing's syndrome and fluid retention.

Dose Up to 2 g daily.

Wolf RL *et al.* (1965). Simultaneous urinary assays for the combined metanephrines and 3-methoxy-4-hydroxyphenylglycol in patients with pheochromocytoma and primary hypertension. *N Engl J Med* 273: 1459–1463.

Tetracycline

Antibiotic

C₂₂H₂₄N₂O₈ = 444.4

CAS—60-54-8 (anhydrous); 6416-04-2 (tri-hydrate)

IUPAC Name A hydrated form of [4S-(4α,4α,5α,6β,12α)]-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacene-carboxamide

Proprietary Names Tetracycline and tetracycline hydrochloride are ingredients of many proprietary preparations, see Sweetman [2002].

Chemical Properties A yellow, crystalline, amphoteric powder, which darkens in moist air on exposure to strong sunlight. Soluble 1 in 2500 of water and 1 in 50 of ethanol; practically insoluble in chloroform and ether; freely soluble in dilute acids and, with decomposition, in solutions of alkali hydroxides. pK_a 3.3, 7.7, 9.7 (25°). Log P (octanol/pH 7.4) 1.4.

Tetracycline Hydrochloride

C₂₂H₂₄N₂O₈.HCl = 480.9

CAS—64-75-5

Chemical Properties A yellow, hygroscopic, crystalline, amphoteric powder, which darkens in moist air on exposure to strong sunlight. Mp about 214°, with decomposition. Soluble 1 in 10 of water and 1 in 100 of ethanol; practically insoluble in chloroform and ether; soluble in methanol and in aqueous solutions of alkali hydroxides and carbonates. Solutions in water become turbid on standing owing to hydrolysis and precipitation of tetracycline.

Colour Tests Benedict's reagent—red; formaldehyde-sulfuric acid—green-yellow—yellow-brown; Liebermann's reagent—black; Mandelin's test—violet—red—orange; Marquis test—orange; sulfuric acid—violet.

Thin-layer Chromatography System TA—R_f 0.05, streaking; system TB—R_f 0.00; system TAE—R_f 0.88 (location under ultraviolet light, orange fluorescence; acidified potassium permanganate solution, positive).

Gas Chromatography System GA—RI 1950.

High Performance Liquid Chromatography System HX—RI 314; system HY—RI 265; system HAA—retention time 9.9 min.

Ultraviolet Spectrum Aqueous acid—270 ($A_1=417a$), 356 nm.

Infrared Spectrum Principal peaks at wavenumbers 1612, 1580, 1660, 1226, 1248, 1530 cm^{-1} (tetracycline hydrochloride, KCl disk).

Quantification

Plasma HPLC UV detection. Limit of detection, 100 $\mu\text{g/L}$ [Hermansson 1982].

Radioimmunoassay Limit of detection, about 20 $\mu\text{g/L}$ [Faraj, Ali 1981].

Urine HPLC See Plasma [Hermansson 1982].

Radioimmunoassay See Plasma [Faraj, Ali 1981].

Disposition in the Body Irregularly and incompletely absorbed after oral administration; widely distributed throughout the body. Up to about 60% of an IV dose and 20 to 50% of an oral dose is excreted in the urine unchanged in 48 h. Excreted in the bile and undergoes some enterohepatic circulation.

Therapeutic Concentration In plasma, usually in the range 1 to 5 mg/L .

Six patients with symptomatic pleural effusions and 1 patient with recurrent pneumothorax were administered 150 mg lidocaine, immediately followed by 20 mg/kg tetracycline instilled in the pleural space through a chest tube. Mean peak plasma concentrations for lidocaine and tetracycline were 1.3 mg/L and 3.6 mg/L , respectively, and these were reached after 86 and 96 min, respectively [Wooten *et al.* 1988].

Half-life Plasma half-life, about 9 h.

Volume of Distribution About 1.3 L/kg.

Clearance Plasma clearance, about 2 mL/min/kg.

Distribution in Blood Plasma: whole blood ratio, about 0.97.

Protein Binding 25 to 65%.

Dose 1 to 2 g daily.

Tetraethylammonium Bromide

Antihypertensive

$\text{C}_8\text{H}_{20}\text{BrN} = 210.2$

IUPAC Name Tetraethylazanium hydrobromide

Synonyms TEAB; tetramone bromide; tetrylammonium bromide; TMD 10.

Proprietary Names Beparon; Bromethyl; Etambro; Etamon(in); Sympatektoman; Teamon; Tetramon.

Chemical Properties Tetraethylammonium bromide is a quaternary ammonium compound. White crystalline powder. Soluble 1 in less than 1 of water, 1 in 1 of ethanol and 1 in 4 of chloroform; freely soluble in acetone.

Thin-layer Chromatography System T1— R_f 0.03 (location reagent acidified iodoplatinate spray, positive reaction).

Dose Up to 500 mg IV.

Δ^9 -Tetrahydrocannabinol

Antiemetic, Appetite Stimulant, Hallucinogen

$\text{C}_{21}\text{H}_{30}\text{O}_2 = 314.5$

CAS—1972-08-3

IUPAC Name (6aR,10aR)-6,6,9-Trimethyl-3-pentyl-6a,7,8,10a-tetrahydrobenzo[c]chromen-1-ol

Synonyms Dronabinol; QCD-84924; (–)- Δ^1 -3,4-*trans*-tetrahydrocannabinol; (6aR,10aR)-6a,7,8,10a-tetrahydro-6,6,9-trimethyl-3-pentyl-6H-dibenzo[b,d]pyran-1-ol; Δ^9 -THC; Δ^1 -THC.

Proprietary Name Marinol

Chemical Properties Light yellow resinous oil that hardens upon refrigeration. Bp 200°. Essentially insoluble in water; soluble 1 in 1 in ethanol and acetone; readily soluble in chloroform and light petroleum. pK_a 10.6 [O'Neil *et al.* 2006]. Log P (octanol/water), 7.6. Binds readily to glass and plastic, limiting recoveries during analytical procedures. Absorption can be minimised by storing solutions in amber silylated glassware and by maintenance of the compound in a basic solution or organic solvent. For a study on the adsorptive loss of 11-nor- Δ^9 -THC-9-carboxylic acid, see Jamerson *et al.* [2005a]. Stability of Δ^9 -THC, 11-hydroxy- Δ^9 -THC, and 11-nor- Δ^9 -THC-9-carboxylic acid in urine was established after 3 freeze-thaw cycles, 72 h at 4°, and 24 h at room temperature [Abraham *et al.* 2007]. Δ^9 -THC concentrations showed a decrease of 26% in urine at –70° in silanised glass. The concentration of Δ^9 -THC in EDTA-plasma decreased steadily, with a decrease of 30% after 21 days and 43% after 41 days [Grauwiler *et al.* 2007].

Colour Test *p*-Dimethylaminobenzaldehyde—red/violet; Duquenois reagent—violet-blue/violet.

Thin-layer Chromatography System TA— R_f 11; system TE— R_f 31; system TI— R_f 30; system TJ— R_f 29; system TAH— R_f 50 (Fast blue B solution—red colour); system TAJ— R_f 00; system TAK— R_f 01; system TAL— R_f 31.

Plates: Merck 60F 254 silica gel. Solvent system: hexane: chloroform: dioxane (89: 8.75: 2.25). UV detection ($\lambda = 220 \text{ nm}$). R_f 0.27. Limit of detection not reported [Debruyne *et al.* 1994].

Gas Chromatography System GA—RI 2473; system GB—RI 2350.

Gas Chromatography-Mass Spectrometry Column: methyl silicone capillary (25 m \times 0.32 mm i.d., 0.25 μm). Carrier gas: N_2 . Temperature: 240°. FID. Retention time: 4.6 min. Limit of detection not reported [Debruyne *et al.* 1994].

High Performance Liquid Chromatography System HL—*k* 13.35.

Column: Waters μ Porasil (150 \times 4.6 mm i.d.). Mobile phase: hexane:chloroform (90:10), flow rate 2 mL/min. UV detection ($\lambda = 220$ nm). Retention time: 4.9 min. Limit of detection not reported [Debruyne *et al.* 1994].

Supercritical Fluid Chromatography Column: Cyanopropyl silica (250 \times 4.6 mm i.d.). Mobile phase: methanol in CO₂ (2% to 7% at 15 min), flow rate 2 mL/min. APCI, positive ion mode, full scan and SIM acquisition mode. Retention time: 5.19 min. Limit of detection, 0.69 ng [Backstrom *et al.* 1997].

Ultraviolet Spectrum Ethanol—283, 276 nm.

Infrared Spectrum Principal peaks at wavenumbers 1580, 1040, 1620, 1180, 1130, 1050 cm⁻¹ (KBr disc).

Mass Spectrum Principal ions at *m/z* 299, 231, 314, 43, 41, 295, 55, 271.

**Quantification**

Blood GC-MS Column: DB-5MS fused silica capillary (15 m \times 0.25 mm i.d., 0.25 μ m). Carrier gas: He, 1 mL/min. Temperature programme: 70° for 1 min to 190° at 25°/min to 210° at 25°/min to 290° at 30°/min for 2.5 min. CI, negative ion mode, SRM acquisition mode. Limit of quantification, 0.5 μ g/L, limit of detection, 0.1 to 0.2 μ g/L [Thomas *et al.* 2007]. Column: Restek Rtx 5-MS capillary (15 m \times 0.25 mm i.d., 0.25 μ m). Temperature programme: 70° for 1 min to 260° at 15°/min for 10 min. Limit of quantification, 1 ng/L; limit of detection, 0.5 ng/L [Ondra *et al.* 2006]. Column: rtx-200 (20 m \times 0.18 mm i.d., 0.2 μ m) and DB-17 (15 m \times 0.25 mm i.d., 0.25 μ m). Carrier gas: He. Temperature programme: 120° to 200° at 20°/min to 250° at 10°/min to 300° at 25°/min. SIM acquisition mode. Limit of quantification, 1.0 μ g/L for both Δ^9 -THC and 11-nor- Δ^9 -THC-9-carboxylic acid [Scurlock *et al.* 2006]. Column: 5% phenylmethyl silicone capillary (12 m \times 0.32 mm i.d., 0.33 μ m). Carrier gas: He, 1.5 mL/min. Temperature programme: 120° for 2 min to 200° at 50°/min to 280° at 15°/min for 5 min. EI ionisation. Limit of

detection, \approx 1 ng/L [Chiarotti, Costamagna 2000]. Column: HP-5MS 5% phenyl 95% methyl siloxane capillary (30 m \times 0.25 mm i.d.). Carrier gas: He, 1.0 mL/min. Temperature programme: 60° for 1 min to 290° at 30°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 0.4 μ g/L Δ^9 -THC, 0.2 μ g/L 11-nor- Δ^9 -THC-9-carboxylic acid [Kintz, Cirimele 1997]. See also Bergman *et al.* [1981]; McCallum *et al.* [1978] and McCallum, Shaw [1981].

LC-MS Column: Symmetry C₁₈ (150 \times 1.5 mm i.d., 5 μ m). Mobile phase: acetonitrile:0.1% formic acid (70:30), flow rate 0.3 mL/min. ESI, positive and negative ion modes. Limit of quantification, 2 μ g/L, limit of detection, 0.5 μ g/L [Teixeira *et al.* 2007].

Plasma GC-MS Column: DB-1MS capillary (15 m \times 0.25 mm i.d., 0.25 μ m). EI ionisation, SIM acquisition mode. Limit of quantification and detection, 0.125 μ g/L [Lowe *et al.* 2007]. Column: HP-5MS 95% dimethylsiloxane 5% diphenylsiloxane capillary (30 m \times 0.25 mm i.d., 0.25 μ m). Temperature programme: 130° for 2 min to 300° at 20°/min for 5 min. SIM acquisition mode. Limit of quantification, 0.80 μ g/L Δ^9 -THC, 0.51 μ g/L 11-hydroxy- Δ^9 -THC, 0.88 μ g/L 11-nor-9-carboxy- Δ^9 -THC, limit of detection, 0.24 μ g/L Δ^9 -THC, 0.15 μ g/L 11-hydroxy- Δ^9 -THC, 0.26 μ g/L 11-nor- Δ^9 -THC-9-carboxylic acid [Nadulski *et al.* 2005a].

HPLC Column: Nucleosil C₁₈ (125 \times 4.6 mm i.d., 3 μ m). Mobile phase: methanol:acetonitrile:5 mmol/L tetrabutylammonium perchlorate solution (pH 3.2; 50:25:25), flow rate 1.2 mL/min. UV detection ($\lambda = 215$ nm). Limit of quantification, 5 μ g/L [Abbara *et al.* 2006]. Column: LiChroCart Superspher 60 RP select B (250 \times 4 mm i.d., 5 μ m). Mobile phase: 5.6 mmol/L tetrabutylammonium hydrogen sulfate (pH 2.3):acetonitrile:tetrahydrofuran (44:46:10) with 160 μ mol/L Na₂EDTA, flow rate 850 μ L/min. Electrochemical detection. Limit of quantification, 5 μ g/L for Δ^9 -THC and 11-nor- Δ^9 -THC-9-carboxylic acid [Kramer, Kovar 1999]. Column: Zorbax C₈ (250 \times 4.6 mm i.d.). Mobile phase: acetonitrile:methanol:1 mol/L sulfuric acid (35:15:50), flow rate 1.8 mL/min. Electrochemical detection. Limit of detection, <0.5 μ g/L [Nakahara *et al.* 1989].

LC-MS Column: Synergi MAX-RP 80A C₁₂ (75 \times 2 mm i.d., 4 μ m). Mobile phase: 10 mmol/L ammonium formate (pH 3.0):acetonitrile:10 mmol/L ammonium formate (90:10; 50:50 for 1 min to 21:79 at 12 min to 5:95 at 12.5 min for 2.5 min to 50:50 at 25 min), flow rate 400 μ L/min. APCI, SIM acquisition mode. Limit of quantification, 0.2 μ g/L for Δ^9 -THC, 11-hydroxy- Δ^9 -THC, and 11-nor- Δ^9 -THC-9-carboxylic acid, limit of detection, 0.1 μ g/L [Grauwiler *et al.* 2007]. Column: Phenomenex Luna phenylhexyl (50 \times 2 mm i.d., 3 μ m). Mobile phase: 5 mmol/L ammonium acetate (pH 6.5):acetonitrile (70:30 for 0.4 min to 10:90 at 7.8 min for 0.4 min to 70:30 at 8.5 min for 2.5 min), flow rate 0.25 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.8 μ g/L for Δ^9 -THC, 11-hydroxy- Δ^9 -THC and 4.3 μ g/L for 11-nor-9-carboxy- Δ^9 -THC, limit of detection, 0.2 μ g/L for Δ^9 -THC and 11-hydroxy- Δ^9 -THC, 1.6 μ g/L for 11-nor- Δ^9 -THC-9-carboxylic acid [Maralikova, Weinmann 2004].

Serum GC-MS Column: VF-5MS capillary (30 m \times 0.25 mm i.d., 0.25 μ m). Carrier gas: He, 1 mL/min. EI ionisation at 70 eV. Limit of quantification, 0.5 μ g/L Δ^9 -THC, 0.3 μ g/L 11-hydroxy- Δ^9 -THC, 6.2 μ g/L 11-nor- Δ^9 -THC-9-carboxylic acid, respectively, limit of detection, 0.2 μ g/L Δ^9 -THC, 0.1 μ g/L 11-hydroxy- Δ^9 -THC, 1.9 μ g/L 11-nor- Δ^9 -THC-9-carboxylic acid [Kauert *et al.* 2007].

LC-MS Column: Luna phenylhexyl (50 \times 2 mm i.d., 3 μ m). Mobile phase: 5 mmol/L ammonium acetate (pH 6.5):acetonitrile (70:30 for 1 min to 10:90 at 4 min for 1 min to 70:30 at 6 min for 4 min), flow rate 0.25 mL. ESI, negative ion mode, MRM acquisition mode. Limit of quantification, 7.5 μ g/L, limit of detection, 2.5 μ g/L [Jung *et al.* 2007].

Urine TLC Plates: TOXI-GRAMS MS (THC) biphasic with alkyl-silica extraction layer (14 \times 5.5 cm). Solvent system: *n*-heptane:acetone:glacial acetic acid (50:50:1). R_f 0.78 for 11-nor- Δ^9 -THC-9-carboxylic acid. Limit of detection, 20 μ g/L for 11-nor- Δ^9 -THC-9-carboxylic acid [King *et al.* 1989].

GC-MS Column: DB-35MS capillary (15 m \times 0.32 mm i.d., 0.25 μ m). Carrier gas: He. Temperature programme: 100° for 1 min to 200° at 35°/min to 250° at 23°/min to 325° at 20°/min for 1 min. SIM acquisition mode. Limit of quantification, 1.0 μ g/L Δ^9 -THC, 2.5 μ g/L 11-hydroxy- Δ^9 -THC, 2.5 μ g/L 11-nor- Δ^9 -THC-9-carboxylic acid, limit of detection, 2.5 μ g/L Δ^9 -THC, 2.5 μ g/L 11-hydroxy- Δ^9 -THC, 2.5 μ g/L 11-nor- Δ^9 -THC-9-carboxylic acid [Abraham *et al.* 2007]. Column: CP Sil fused silica capillary (12.5 m \times 0.25 mm i.d., 0.4 μ m). Temperature programme: 160° for 2 min to 320° at 20°/min for 2 min. SIM acquisition mode. Limit of quantification, 2.6 μ g/L for 11-nor- Δ^9 -THC-9-carboxylic acid; limit of detection, 0.8 μ g/L for 11-nor- Δ^9 -THC-9-carboxylic acid [Dietz *et al.* 2007]. Column: Zebtron ZB-5MS Phenomenex capillary (30 m \times 0.25 mm, 0.25 μ m). Carrier gas: He, 1.4 mL/min. Temperature programme: 120° to 235 at 20°/min to 250° at 3°/min to 340° at 25°/min. SIM acquisition mode. Limit of detection, 1 ng [Huq *et al.* 2005]. Column: Supelco 5% phenylmethyl silicone capillary (17 m \times 0.2 mm i.d., 0.33 μ m) or HP1 methyl silicone capillary (30 m \times 0.2 mm i.d., 0.11 μ m). Carrier gas: He, 1.1 mL/min. Temperature programme: 160° for 0.5 min to 280° at 15°/min to 320° at 50°/min for 3 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 5 μ g/L for 11-nor- Δ^9 -THC-9-carboxylic acid [Strano-Rossi *et al.* 2005]. Column: DB-5MS bonded phase capillary (15 m \times 0.25 mm i.d., 0.25 μ m). Carrier gas: He. Temperature programme: 230° to 290° at 55°/min for 1.0 min. SIM acquisition mode. Retention time: 1.8 min. Limit of quantification, 3.8 μ g/L for 11-nor- Δ^9 -THC-9-carboxylic acid, limit of detection, 3.8 μ g/L for 11-nor- Δ^9 -THC-9-carboxylic acid [Jamerson *et al.* 2005a]. See also Chiarotti, Costamagna [2000]; Jamerson *et al.* [2005b] and Kintz *et al.* [1995].

HPLC Column: LiChroCart Superspher 60 RP select B (250 \times 4 mm i.d., 5 μ m). Mobile phase: 5.6 mmol/L tetrabutylammonium hydrogen sulfate (pH 2.3):acetonitrile:tetrahydrofuran (44:46:10) with 160 μ mol/L Na₂EDTA, flow rate

850 $\mu\text{L}/\text{min}$. Electrochemical detection. Limit of quantification, 15 $\mu\text{g}/\text{L}$ for 11-nor-9-carboxy- Δ^9 -THC [Kramer, Kovar 1999]. Column: RP-8 reversed phase (250 \times 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile:0.125 mol/L phosphate buffer (55:45), flow rate 1 mL/min. DAD ($\lambda = 212 \text{ nm}$). Retention time: $\approx 12 \text{ min}$. Limit of detection, 10 $\mu\text{g}/\text{L}$ for 11-nor- Δ^9 -THC-9-carboxylic acid [Bianchi, Donzelli 1996]. Column: ODS (100 \times 3.2 mm i.d., 3 μm). Mobile phase: 100 mL 0.5 mol/L monochloroacetic acid (pH 3.0) and 1.4 mL TEA to 1 L with water-methanol (30:70): 100 mL 0.5 mol/L monochloroacetic acid (pH 3.0) and 1.4 mL TEA to 1 L with water-tetrahydrofuran-methanol (5:15:80; 90:10 to 70:30 at 15 min to 40:60 at 30 min for 5 min), flow rate 1.0 mL/min. Electrochemical detection. Limit of quantification, 12 $\mu\text{g}/\text{L}$ for 11-nor- Δ^9 -THC-9-carboxylic acid [Fisher *et al.* 1996]. Column: Zorbax C₈ (250 \times 4.6 mm i.d.). Mobile phase: acetonitrile: methanol: 0.1 mol/L sulfuric acid (35:15:50), flow rate 1.8 mL/min. Electrochemical detection. Limit of detection, <0.5 $\mu\text{g}/\text{L}$ [Nakahara *et al.* 1989].

LC-MS Column: Synergi MAX-RP 80A C12 (75 \times 2 mm i.d., 4 μm). Mobile phase: 10 mmol/L ammonium formate (pH 3.0): acetonitrile-10 mmol/L ammonium formate (90:10; 50:50 for 1 min to 21:79 at 12 min to 5:95 at 12.5 min for 2.5 min to 50:50 at 25 min), flow rate 400 $\mu\text{L}/\text{min}$. APCI, SIM acquisition mode. Limit of quantification, 1 $\mu\text{g}/\text{L}$ for Δ^9 -THC and 11-nor- Δ^9 -THC-9-carboxylic acid, 2 $\mu\text{g}/\text{L}$ for 11-hydroxy- Δ^9 -THC; limit of detection, 0.5 $\mu\text{g}/\text{L}$ for Δ^9 -THC and 11-nor- Δ^9 -THC-9-carboxylic acid, 1 $\mu\text{g}/\text{L}$ for 11-hydroxy- Δ^9 -THC [Grauwiler *et al.* 2007]. Column: Luna phenylhexyl (50 \times 2 mm i.d., 3 μm). Mobile phase: 5 mmol/L ammonium acetate (pH 6.5): acetonitrile (70:30 for 1 min to 10:90 at 4 min for 1 min to 70:30 at 6 min for 4 min), flow rate 0.25 mL. ESI, negative ion mode, MRM acquisition mode. Limit of quantification, 5 $\mu\text{g}/\text{L}$, limit of detection, 2.5 $\mu\text{g}/\text{L}$ [Jung *et al.* 2007]. Column: Symmetry C₁₈ (150 \times 1.5 mm i.d., 5 μm). Mobile phase: acetonitrile: 0.1% formic acid (70:30), flow rate 0.3 mL/min. ESI, positive and negative ion modes. Limit of quantification, 2 $\mu\text{g}/\text{L}$; limit of detection, 0.5 $\mu\text{g}/\text{L}$ [Teixeira *et al.* 2007]. Column: Waters 2695 HPLC-Micromass Quattro II reversed phase C₁₈ (200 \times 4.6 mm i.d.). Mobile phase: methanol: water (85:15). APCI, positive ion mode, SIM acquisition mode. Limit of detection not reported [Yang, Xie 2006]. Column: RP-C8-select B (125 \times 2 mm i.d., 5 μm). Mobile phase: 5 mmol/L ammonium formate-0.1% formic acid (pH 3): acetonitrile-0.1% formic acid (90:10 for 6.6 min to 70:30 at 26.6 min to 30:70 at 33.3 min to 10:90 for 4 min). ESI, positive ion mode, MRM acquisition mode. Limit of detection, <10 $\mu\text{g}/\text{L}$ for 11-nor- Δ^9 -THC-9-carboxylic acid [Weinmann *et al.* 2000]. Column: Zorbax Eclipse XDB-C₈ reversed phase (150 \times 3.0 mm i.d., 5 μm). Mobile phase: 4 mmol/L formic acid in water: 4 mmol/L formic acid in acetonitrile (40:60 for 0.5 min to 20:80 at 3 min for 4 min to 40:60 over 3 min), flow rate 0.5 mL/min. API, ESI, positive ion mode, SIM acquisition mode. Limit of detection, 2 $\mu\text{g}/\text{L}$ [Breindahl, Andreasen 1999].

Meconium GC-MS Column: Agilent DB-5 MS (15 m \times 0.25 mm i.d., 0.25 μm) and Agilent DB-17 MS (15 m \times 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 200° for 0.2 min to 280° at 15°/min for 3.8 min. EI ionisation, FID, SIM acquisition mode. Limit of quantification, 10 $\mu\text{g}/\text{kg}$, limit of detection, 5 $\mu\text{g}/\text{kg}$ [Marin *et al.* 2007]. Column: DB-5MS (15 m \times 0.2 mm i.d., 0.25 μm). Temperature programme: 200° for 0.2 min to 275° at 60°/min for 3 min to 300° at 20°/min to 325° at 60°/min for 1.5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 10 $\mu\text{g}/\text{kg}$; limit of detection, 5 $\mu\text{g}/\text{kg}$ [Coles *et al.* 2005].

Oral Fluid GC-MS Column: Ultra 1 methyl silicone capillary (16.5 m \times 0.2 mm i.d., 0.11 μm). Carrier gas: He, 0.8 mL/min. Temperature programme: 70° for 2 min to 160° at 30°/min to 170° at 5°/min to 200° at 20°/min to 220° at 10°/min to 300° at 30°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 1.9 $\mu\text{g}/\text{L}$, limit of detection, 0.6 $\mu\text{g}/\text{L}$ [Pujadas *et al.* 2007]. Column: HP-5 capillary (30 m \times 0.32 mm i.d., 0.25 μm). Carrier gas: He, 1.8 mL/min. Temperature programme: 70° for 1 min to 300° at 20°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 2 $\mu\text{g}/\text{L}$, limit of detection, 1 $\mu\text{g}/\text{L}$ [Drummer *et al.* 2007]. Column: VF-1MS capillary (30 m \times 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1 mL/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 2.4 $\mu\text{g}/\text{L}$, limit of detection, 0.5 $\mu\text{g}/\text{L}$ [Kauert *et al.* 2007]. Column: DB-5MS (15 m \times 0.25 mm i.d., 0.25 μm). Temperature programme: 125° for 5 min to 250° at 40°/min for 1.3 min to 300° at 70°/min. SIM acquisition mode. Limit of quantification, 0.5 $\mu\text{g}/\text{L}$ [Moore *et al.* 2007]. Column: J and W DB-5 (15 m \times 0.25 mm i.d., 1.0 μm). Temperature programme: 130° to 300° at 30°/min. Negative ion mode. Limit of quantification, 10 ng/L [Day *et al.* 2006]. See also Gunnar *et al.* [2005].

HPLC Column: LiChrospher Select B RP-8 (125 \times 4 mm i.d., 5 μm). Mobile phase: methanol-0.15 mol/L aqueous sodium chloride (20:80): methanol-0.15 mol/L aqueous sodium chloride (82:18; 100:0 for 5 min to 0:100 at 5.1 min until 25 min to 100:0 at 25.1 min for 10 min), flow rate 0.8 mL/min. UV detection ($\lambda = 220 \text{ nm}$). Limit of detection, 2 mg/L [Kircher, Parlar 1996].

LC-MS Column: Xterra C₁₈ MS reversed phase (150 \times 2.1 mm i.d., 3.5 μm). Mobile phase: 10 mmol/L aqueous ammonium formate (pH 3.5): methanol (77:23 for 0.2 min to 4:96 at 6 min for 3 min), flow rate 200 $\mu\text{L}/\text{min}$. TOF-ESI, positive ion mode. Limit of quantification, 0.1 $\mu\text{g}/\text{L}$, limit of detection, 0.05 $\mu\text{g}/\text{L}$ [Quintela *et al.* 2007]. Column: Symmetry C₁₈ (150 \times 1.5 mm i.d., 5 μm). Mobile phase: acetonitrile: 0.1% formic acid (70:30), flow rate 0.3 mL/min. ESI, positive and negative ion modes. Limit of quantification, 5 $\mu\text{g}/\text{L}$, limit of detection, 2 $\mu\text{g}/\text{L}$ [Teixeira *et al.* 2007]. Column: Atlantis dC₁₈ (50 \times 2.1 mm i.d., 3.5 μm). Mobile phase: acetonitrile: 5 mmol/L aqueous ammonium acetate (pH 5; 10:90 to 40:60 at 4 min to 90:10 at 4.1 min for 3.9 min to 10:90 at 8.1 min), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, <0.16 $\mu\text{g}/\text{L}$ [Oiestad *et al.* 2007]. Column: Xterra MS C₁₈ (50 \times 2.1 mm i.d., 3.5 μm). Mobile

phase: acetonitrile: 0.05% ammonia (70:30), flow rate 0.3 mL/min. ESI, positive ion mode, single ion recording. Limit of quantification, 2 $\mu\text{g}/\text{L}$, limit of detection, 1 $\mu\text{g}/\text{L}$ [Teixeira *et al.* 2004, 2005]. Column: Xterra MS C₁₈ (100 \times 2.1 mm i.d., 3.5 μm). Mobile phase: 0.1% formic acid: acetonitrile (15:85), flow rate 0.25 mL/min. ESI, positive ion mode. Limit of quantification, 2 $\mu\text{g}/\text{L}$ [Concheiro *et al.* 2004]. **Sweat GC-MS** CI, negative ion mode. Limit of quantification, 0.4 ng [Huestis *et al.* 2008].

Brain GC-MS Column: 6% OV-1 or Hi-EFF 9BP. FPD. Limit of detection, 10 $\mu\text{g}/\text{kg}$ [McCallum *et al.* 1978].

Hair GC-MS Column: DB-5MS capillary (30 m \times 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 1 min to 275° at 35°/min for 3 min to 300° at 25°/min for 3.5 min. CI, negative ion mode, MRM acquisition mode. Limit of quantification, 0.05 ng/kg for 11-nor- Δ^9 -THC-9-carboxylic acid, limit of detection, 0.02 ng/kg for 11-nor- Δ^9 -THC-9-carboxylic acid [Kim, In 2007]. Column: DB-5MS capillary (15 m \times 0.25 mm i.d., 1.0 μm). Temperature programme: 180° to 278° at 30°/min to 282° at 5°/min to 300° at 35°/min for 2.5 min. CI, positive ion mode for Δ^9 -THC, negative ion mode for 11-nor- Δ^9 -THC-9-carboxylic acid, SRM acquisition mode. Limit of quantification, 1 ng/kg for Δ^9 -THC, 0.1 ng/kg for 11-nor- Δ^9 -THC-9-carboxylic acid [Huestis *et al.* 2007]. Column: HP-5MS capillary. Temperature programme: 130° for 2 min to 300° at 20°/min. SIM acquisition mode. Limit of quantification, 37 ng/kg, limit of detection, 12 ng/kg [Nadulski, Pragst 2007]. Column: DB-35 MS (40 m \times 0.18 mm i.d., 0.18 μm) and DB-1 (15 m \times m i.d., 0.25 mm). Carrier gas: He, 1.6 mL/min. Temperature programme: 100° for 0.5 min to 200° at 50°/min to 260° at 10°/min for 2.9 min to 220° at 120°/min. CI, negative ion mode, SIM acquisition mode. Limit of quantification, 0.05 ng/kg [Moore *et al.* 2006]. Column: Supelco Equity 1 capillary (30 m \times 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 70° for 1 min to 240° at 40°/min for 1 min to 280° at 20°/min for 5 min. CI, negative ion mode. Limit of quantification, 100 ng/kg, limit of detection, 50 ng/kg [Marsili *et al.* 2005]. See also Baptista *et al.* [2002]; Chiarotti and Costamagna [2000]; Deveaux *et al.* [2000]; Kim *et al.* [2005]; Sachs and Dressler [2000] and Strano-Rossi and Chiarotti [1999].

Nail GC-MS Column: HP-1 cross linked dimethyl silicone capillary (30 m \times 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 150° to 300° at 10°/min for 10 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, <0.1 $\mu\text{g}/\text{kg}$ for Δ^9 -THC and 11-nor- Δ^9 -THC-9-carboxylic acid [Lemos *et al.* 1999].

Other GC-MS Indoor Air. Column: HP-5MS fused silica capillary (25 m \times 0.2 mm i.d., 0.33 μm). Carrier gas: He, 1 mL/min. Temperature programme: 40° for 1 min to 250° at 25°/min for 25 min. EI ionisation at 70 eV, CI, positive ion mode. Retention time, 13.7 min. Limit of quantification, 125 ng/m³, limit of detection, 100 ng/m³ [Chou *et al.* 2007].

HPLC Foods Containing Hemp. Column: Nucleosil 120-3 C₁₈ (125 \times 2 mm i.d.). Mobile phase: acetonitrile: 8.6 g/L 85% phosphoric acid (55:45 to 80:20 at 25 min to 90:10 at 26 min for 4 min to 55:45 at 31 min for 9 min). UV detection ($\lambda = 210 \text{ nm}$). Limit of detection, 0.1 ng [Zoller *et al.* 2000]. Rat Cortex and Corpus Striatum. Column: ODS μ Bondapak C₁₈ reversed phase (300 \times 4 mm i.d., 10 μm). Mobile phase: methanol: acetonitrile: 0.01 mol/L sulfuric acid (21:24:55), flow rate 3.0 mL/min. Electrochemical detection. Limit of detection, 1.5 ng [Nyoni *et al.* 1996].

LC-MS Mouse Brain and Blood. Column: Waters 2695 HPLC-Micromass Quattro II reversed phase C₁₈ (200 \times 4.6 mm i.d.). Mobile phase: methanol: water (85:15). APCI, positive ion mode, SIM acquisition mode. Limit of detection not reported [Yang, Xie 2006]. Wastewater. Column: Xterra MS C₁₈ (100 \times 2.1 mm i.d., 3.5 μm). Mobile phase: 0.05% TEA: acetonitrile (100:0 to 55:45 in 12 min to 0:100 in 2 min for 2 min to 100:0 in 2 min for 8 min), flow rate 200 $\mu\text{L}/\text{min}$. ESI, negative ion mode, MRM acquisition mode. Limit of quantification, 1.75 and 0.94 $\mu\text{g}/\text{L}$ for 11-nor- Δ^9 -THC-9-carboxylic acid in influent and effluent waste water, respectively, limit of detection, 307 pg [Castiglioni *et al.* 2006].

Note For a clinical evaluation of the Toxi Prep system for the screening of THC metabolites in urine, see Steinberg *et al.* [1997].

Disposition in the Body Δ^9 -THC is absorbed from the gastrointestinal tract but absorption is slow and irregular. However, Δ^9 -THC can be measured in plasma within seconds of inhalation of marijuana smoke. Δ^9 -THC is lipophilic and is widely distributed in the body. It is hydroxylated to the active metabolite 11-hydroxy- Δ^9 -THC by the hepatic CYP2C9 enzyme, and this is further oxidised to the intermediate 11-oxo-THC, followed by oxidation to 11-nor- Δ^9 -THC-9-carboxylic acid. Many other polar mono- and dicarboxylic acids are formed, which are conjugated with glucuronic acid to a variable extent. The inactive substances 8α -hydroxy- Δ^9 -THC and 8α ,11-dihydroxy- Δ^9 -THC are also formed by the action of CYP3A4. 11-nor- Δ^9 -THC-9-carboxylic acid undergoes glucuronidation of the carboxy group and this is excreted in the urine and can be detected up to 4 days after smoking one marijuana cigarette and up to 4 weeks after frequent use. Levels of THC increase rapidly after smoking, peak before the end of smoking, and quickly dissipate. Mean peak levels of 11-hydroxy- Δ^9 -THC are substantially lower than THC levels and occur directly after the cessation of smoking. 11-nor- Δ^9 -THC-9-carboxylic acid levels increase slowly and plateau for a long period of time. 11-nor- Δ^9 -THC-9-carboxylic acid glucuronide is present in blood at higher concentrations than the unconjugated acid and is unstable to hydrolysis, a common cause of misinterpretation for the prediction of cannabis exposure [Maurer *et al.* 2006]. Enterohepatic recirculation of metabolites may occur. Up to $\approx 25\%$ of a dose is excreted in the urine in 3 days, mainly as 11-nor- Δ^9 -THC-9-carboxylic acid glucuronide, together with the other carboxylic acids in free and conjugated form. The Δ^9 -THC-*O*-glucuronide has been detected in urine. The major excretion route is via

the faeces, with up to ~65% of a dose being excreted in 5 days, mainly as 11-hydroxy- Δ^9 -THC and the carboxylic acids in conjugated form. Δ^9 -THC metabolites have been detected in urine for up to 12 days following a single oral dose. Δ^9 -THC crosses the placenta and is distributed into breast milk.

Blood Concentrations

Six volunteers with histories of marijuana use ingested liquid hemp oil (0.39 and 14.8 mg Δ^9 -THC/day), hemp oil in capsules (0.47 mg Δ^9 -THC/day), dronabinol capsules (7.5 mg Δ^9 -THC/day), or placebo. Plasma Δ^9 -THC and 11-hydroxy- Δ^9 -THC levels were low and never exceeded 6.1 µg/L. Analytes were detectable 1.5 h after the initial dosing with the 7.5 mg Δ^9 -THC/day regimen and 4.5 h after the start of the 14.8 mg Δ^9 -THC/day protocol. 11-nor- Δ^9 -THC-9-carboxylic acid levels peaked at 3.1 µg/L during dosing with the low dose hemp oils. Fifteen and a half hours following the last THC dose, all plasma samples were negative for Δ^9 -THC and 11-hydroxy-THC, although plasma 11-nor- Δ^9 -THC-9-carboxylic acid levels persisted for at least 39.5 h after the end of dosing [Goodwin *et al.* 2006].

The distribution of 11-nor- Δ^9 -THC-9-carboxylic acid was investigated in postmortem specimens of 50 deaths in traffic accidents in New Jersey, USA. The mean concentration in heart blood, urine and bile was 0.081 (0.016 to 0.33), 0.314 (0.044 to 2.33) and 12.9 (1.03 to 43.7) mg/L, respectively. Vitreous humour samples were negative or below the limit of detection, [Lin, Lin 2005].

Twenty-four volunteers (12 male, 12 female; aged 18 to 45 years) were administered one of 10 mg Δ^9 -THC, cannabis extract (10 mg Δ^9 -THC + 5.4 mg cannabidiol), or water, and blood samples were obtained. Mean peak concentrations of Δ^9 -THC were 3.19 and 4.05 µg/L, respectively, attained at 63.6 and 56 min, respectively, for the dosed groups, although there was some evidence that cannabidiol partially inhibited the CYP2C-catalysed hydroxylation of Δ^9 -THC to 11-hydroxy- Δ^9 -THC [Nadulski *et al.* 2005b].

Ingestion of 20 mg Δ^9 -THC resulted in mean peak plasma concentrations of 6 µg/L, with a range from 4.4 to 121 µg/L. Higher plasma concentrations of 11-hydroxy- Δ^9 -THC were observed, possibly as a result of first-pass metabolism [Kochanowski, Kala 2005]. Passive inhalation of marijuana smoke has resulted in plasma Δ^9 -THC levels of 1 to 7 µg/L and urine 11-nor- Δ^9 -THC-9-carboxylic acid levels as high as 39 µg/L [Baselt 2004].

Seven healthy participants with histories of marijuana use received 0, 0.39, 0.47, 7.5 and 14.8 mg Δ^9 -THC/day orally for 5 days in a double-blind randomised study. There were no differences in mean time of maximum excretion rate, mean maximum excretion rate, and mean terminal half-life between the 4 Δ^9 -THC doses, with respective ranges of 67.4 to 94.9 h, 0.9 to 16.3 µg/h and 44.2 to 64.0 h [Gustafson *et al.* 2004].

Six healthy men with histories of marijuana use smoked a single marijuana cigarette (placebo, 1.75% or 3.55% Δ^9 -THC). The smoking protocol consisted of a 2 s inhalation, a 10 s hold period, and a 72 s exhalation and rest period. A total of eight puffs were inhaled in 11.2 min. Mean plasma levels of 7.0 and 18.1 µg/L Δ^9 -THC were observed after the first inhalation of the 1.75% and 3.55% Δ^9 -THC cigarettes, respectively. Levels continued to increase rapidly to mean peak plasma concentrations of 79.0 and 152.0 µg/L for the 1.75% and 3.55% Δ^9 -THC cigarettes, respectively, attained after 9 min (before inhalation of the last puff sequence at 9.8 min) [Huestis *et al.* 1992].

After 11 subjects had smoked 11.6 to 15.6 mg (mean 13.0) of Δ^9 -THC from a cigarette over a period of 5 to 7 min, peak plasma concentrations of 0.03 to 0.12 mg/L (mean 0.08) Δ^9 -THC were observed within 3 min of termination of smoking; the concentration fell rapidly to 0.003 to 0.01 mg/L (mean 0.007) at 1 h and to 0.0006 to 0.003 mg/L (mean 0.0016) at 4 h, after smoking. When 20 mg Δ^9 -THC was given orally to the same subjects, peak plasma concentrations of 0.004 to 0.01 mg/L Δ^9 -THC were produced between 60 and 300 min after ingestion [Ohlsson *et al.* 1980].

Note For information on vaporisation as a smokeless cannabis delivery system, see Abrams *et al.* [2007]. For a trial investigating the efficacy of Δ^9 -THC in the treatment of spasticity in spinal cord injury, see Hagenbach *et al.* [2007], and for its efficacy in Tourette's syndrome, see Muller-Vahl *et al.* [2002].

Toxicity Δ^9 -THC intoxication may result in loss of consciousness, or even death, but reports of fatalities are rare. The following Δ^9 -THC levels were reported following 6 cardiovascular fatalities after cannabis use: 22, 4, 2, 5, 3 and 7 µg/L; no other drugs were detected apart from 400 mg/L ethanol in the fourth case [Bachs, Morland 2001].

The following postmortem levels were reported following a case of fatal poisoning by Δ^9 -THC: liver 37.5 µg/g, kidney 42 µg/g, and spleen 12 µg/g [Tewari, Sharma 1980].

Bioavailability After ingestion, ≈6 to 20%. During smoking, ≈18 to 50%.

Half-life In plasma of frequent users ≈2 h.

Volume of Distribution Approximately 10 L/kg.

Distribution in Blood Plasma: whole blood ratio 1.8.

Protein Binding 94 to 99%.

Tetrahydrogestrinone

Anabolic Steroid

C₂₁H₂₈O₂ = 312.5

CAS—618903-56-3

IUPAC Name (8S,13S,14S,17S)-13,17-Diethyl-17-hydroxy-1,2,6,7,8,14,15,16-octahydrocyclopenta[a]phenanthren-3-one

Synonyms (17 α)-13-Ethyl-17-hydroxy-18,19-dinorpregna-4,9,11-trien-3-one; 18a-homopregna-4,9,11-trien-17 β -ol-3-one; THG.

Chemical Properties Stock solutions of tetrahydrogestrinone (THG) were stable at -20° for at least a year. THG in human urine was stable for at least 4 h at room temperature, for at least 15 days at -20° , and after freeze-thaw cycles [Marques *et al.* 2007]. THG is stable in equine plasma for 24 h at room temperature, 13 days at 4° , and 34 days at -20° and -70° [Guan *et al.* 2005].

Mass Spectrum Principal ions at *m/z* 227, 265, 211, 240, 312, 225, 197, 181.

Quantification

Urine GC-MS Column: HP-1 100% methylsiloxane capillary (17 m \times 0.2 mm i.d., 0.11 μ m). Carrier gas: He, 1 mL/min. Temperature programme: 140° for 1 min to 180° at 40° /min to 240° at 3° /min to 300° at 40° /min for 3 min. Limit of quantification, 6 μ g/L, limit of detection, 3 μ g/L [Marques *et al.* 2007]. Column: Hyperclone BDS (50 \times 2 mm i.d., 5.0 μ m). Carrier gas: 1 mL/min. Temperature programme: 200° for 0.5 min, to 273° at 5° /min, to 310° at 30° /min for 2 min. SIM acquisition mode. Limit of detection, <0.5 μ g/L [Catlin *et al.* 2004].

LC-MS Column: Acquity BEH C₁₈ (50 \times 2.1 mm i.d., 1.7 μ m). Mobile phase: 1% formic acid in acetonitrile: 0.1% formic acid in water (5:95 to 30:70 after 2 min for 1.3 min to 90:10 in 2.9 min to 100:0 in 0.7 min). Limit of quantification, 0.8 μ g/L; limit of detection, 0.2 μ g/L [Touber *et al.* 2007]. Column: Waters Symmetry C₁₈ (150 \times 3.0 mm i.d., 5.0 μ m). Mobile phase: water-acetonitrile (90:10): water-acetonitrile (10:90; 65:35 to 0:100 in 20 min). ESI, positive ion mode. Limit of detection, 15 μ g/L [Nielen *et al.* 2006]. Column: Zorbax C₁₈ (50 \times 2.1 mm i.d., 1.8 μ m). Mobile phase: 0.1% acetic acid: acetonitrile with 0.1% acetic acid (85:15 to 40:60 at 5 min to 0:100 at 7 min), flow rate 0.3 mL/min. Positive ion mode, MRM acquisition mode. Limit of detection, 1 to 30 μ g/L [Mazzarino, Botre 2006]. Column: Macherey-Nagel Nucleodur C₁₈ Pyramid (70 \times 40 mm i.d., 5.0 μ m). Mobile phase: acetonitrile: 5 mmol/L ammonium acetate containing 0.1% acetic acid (pH 3.5; 10:90 to 100:0 in 10 min), flow rate 800 μ L/min. ESI, positive ion mode. Limit of detection, 50 μ g/L [Thevis *et al.* 2005]. Column: Hyperclone BDS (50 \times 2 mm i.d., 5.0 μ m). Mobile phase: 0.1% acetic acid: methanol (15:85), flow rate 0.2 mL/min. MRM acquisition mode. Limit of detection, <0.5 μ g/L [Catlin *et al.* 2004].

Other LC-MS Bovine Urine. Column: Acquity BEH C₁₈ (50 \times 2.1 mm i.d., 1.7 μ m). Mobile phase: 1% formic acid in acetonitrile: 0.1% formic acid in water (5:95 to 30:70 after 2 min for 1.3 min to 90:10 in 2.9 min to 100:0 in 0.7 min). Limit of detection, 2 μ g/L [Touber *et al.* 2007]. Equine Plasma. Column: Ac₈ (50 \times 2.1 mm i.d., 5.0 μ m). Mobile phase 2 mmol/L ammonium formate: methanol (40:60 for 4 min to 10:90 at 8 min to 40:60 at 8.1 min), flow rate 300 μ L/min for 8.1 min to 400 μ L/min until 10.4 min to 300 μ L/min at 10.5 min. Limit of detection, 25 ng/L [Guan *et al.* 2005].

Tetramisole

Anthelmintic (Veterinary)

$C_{11}H_{12}N_2S = 204.3$

CAS—5036-02-2

IUPAC Name 6-Phenyl-2,3,5,6-tetrahydroimidazo[2,1-*b*][1,3]thiazole

Synonym 2,3,5,6-Tetrahydro-6-phenylimidazo[2,1-*b*]thiazole

Chemical Properties Crystals. Mp 87° to 89°. Practically insoluble in water; soluble in chloroform.

Tetramisole Hydrochloride

$C_{11}H_{12}N_2S \cdot HCl = 240.8$

CAS—5086-74-8

Proprietary Names *Ascarotrat*; *Ascaverm*; *Cofasol*; *Tetramizotil*.

Chemical Properties A white to pale cream-coloured crystalline powder. Mp 264° to 265°. Soluble 1 in 5 of water, 1 in 50 of ethanol, 1 in 3000 of chloroform and 1 in 10 of methanol; very slightly soluble in ether.

For analytical data see also under Levamisole.

Thin-layer Chromatography System TA— R_f 0.69; system TB— R_f 0.18; system TC— R_f 0.54; system TE— R_f 0.66; system TL— R_f 0.46; system TAE— R_f 0.51; system TAF— R_f 0.53; system TAJ— R_f 0.09; system TAK— R_f 0.00; system TAL— R_f 0.06.

High Performance Liquid Chromatography System HX—RI 261; system HY—RI 222; system HAA—retention time 7.0 min.

Ultraviolet Spectrum

Disposition in the Body

Note For a review of the pharmacokinetics of anthelmintic drugs, see Edwards and Breckenridge [1988].

Dose 2.5 to 5 mg/kg of tetramisole hydrochloride as a single dose.

Edwards G, Breckenridge AM (1988). Clinical pharmacokinetics of anthelmintic drugs. *Clin Pharmacokin* 15: 67–93.

Tetrazepam

Benzodiazepine, Muscle Relaxant, Tranquilliser

$C_{16}H_{17}ClN_2O = 288.8$

CAS—10379-14-3

IUPAC Name 7-Chloro-5-cyclohexen-1-yl-1-methyl-3*H*-1,4-benzodiazepin-2-one

Synonym 7-Chloro-5-(1-cyclohexen-1-yl)-1,3-dihydro-1-methyl-2*H*-1,4-benzodiazepin-2-one

Proprietary Names *Megavix*; *Miolastan*; *Mobiforton*; *Musapam*; *Musaril*; *Muskelat*; *Myolastan*; *Myospasmal*; *Panos*; *Rilex*; *Tepam*; *Tethexal*; *Tetra-saar*; *Tetramidura*; *Tetrazep*.

Chemical Properties Yellow-brown crystals. Mp 144°. Log *P* (octanol/water), 3.2 [Capella-Peiro *et al.* 2002]. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

Colour Test Formaldehyde–sulfuric acid—orange.

Thin-layer Chromatography System TA— R_f 0.78 (tetrazepam); R_f 0.77 (M-nor) 0.05; system TAD— R_f 0.67 (tetrazepam); R_f 0.56 (M-nor); system TAE— R_f 0.84 (tetrazepam); R_f 0.85 (M-nor); system TAF— R_f 0.89 (tetrazepam); R_f 0.92 (M-nor); system TAG— R_f 0.66 (tetrazepam); R_f 0.60 (M-nor); system TB— R_f 0.32 (tetrazepam); R_f 0.5 (M-nor); system TC— R_f 0.69 (tetrazepam); R_f 0.58 (M-nor); system TD— R_f 0.57 (tetrazepam); R_f 0.35 (M-nor); system TE— R_f 0.79 (tetrazepam); R_f 0.73 (M-nor); system TF— R_f 0.49 (tetrazepam); R_f 0.45 (M-nor).

Gas Chromatography System GA—RI 2430 tetrazepam; RI 2530 M (nor-); RI 2570 M (OH-) isomer 1; RI 2580 M (OH-) isomer 2; RI 2430 M (oxo-). (Tetrazepam does not form a TMS derivative).

High Performance Liquid Chromatography System HAA—RT 22.4 min; system HX—RI 511; system HY—RI 483.

Ultraviolet Spectrum Aqueous acid—239 ($A_1^1 = 940b$), 284, 345; aqueous alkali—305 nm ($A_1^1 = 84b$) nm.

Infrared Spectrum Principal peaks at wavenumbers 1678, 1602, 825, 1132, 1310, 800 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 253, 288, 287, 289, 225, 259, 254, 41.

Quantification

Plasma GC Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 μ m). Carrier gas: H_2 , 1.5 mL/min. Temperature programme: 100° to 220° at 20°/min for 15 min to 300° at 20°/min for 5 min. ECD. Limit of detection, 20 μ g/L [Pavlic *et al.* 2007].

LC-MS Column: LiChroCart (125 × 2 mm i.d.). Mobile phase: 5 mmol/L aqueous ammonium formate (pH 3.0): acetonitrile (60:40 for 5.5 min to 10:90 until 8 min to 60:40 until 10 min), flow rate 0.4 mL/min for 5.5 min to 0.7 mL/min until 8 min to 0.65 mL/min until 9.5 min to 0.4 mL/min for 0.5 min. APCI, SIM or scan acquisition mode, positive ion mode. Limit of quantification, 025 μ g/L (SIM), limit of detection, 5 μ g/L (scan) [Kratzsch *et al.* 2004].

Serum HPLC Column: Eclipse XD8C-8 (150 × 4.6 mm i.d., 5 μ m) or Kromasil C₁₈ (120 × 4.6 mm i.d., 5 μ m). Mobile phase: 0.06 mol/L SDS:butanol (pH 7.0, 95:5), flow rate 1.0 mL/min. UV detection ($\lambda = 230$ nm). Limit of detection, 10 μ g/L [Capella-Peiro *et al.* 2002]. Column: C₁₈ reversed phase (250 × 4 mm i.d., 10 μ m). Mobile phase: acetonitrile:5 mmol/L perchloric acid and 10 mmol/L sodium perchlorate (40:60), flow rate 1.5 mL/min. UV detection ($\lambda = 254$ nm). Retention time: 8.2 min. Limit of detection, 500 ng/L for tetrazepam and 100 ng/L for desmethyltetrazepam [Baumgärtner *et al.* 1984].

Urine GC See Plasma [Pavlic *et al.* 2007].

GC-MS Column: 5% OV-101 Chromosorb G HP 100/120 mesh (60 cm × 2 mm i.d.). Carrier gas: N₂, 30 mL/min. Temperature: 100° to 310° at 30°/min. EI ionisation at 70 eV. Limit of detection not reported [Maurer, Pflieger 1987].

CE Column: fused silica capillary (60/50 cm total/effective length × 75 μm i.d.). Running buffer: 15 mmol/L borate buffer (pH 10.2) containing 40 mmol/L sodium dodecylsulfate. UV detection (λ = 228 nm). Limit of detection, 300 μg/L [Berzas Nevado *et al.* 2006].

Saliva LC-MS Column: XTerra MS C₁₈ (100 × 2.1 mm i.d., 3.5 μm). Mobile phase: acetonitrile:0.1% formic acid (5:95 to 80:20 at 10 min), flow rate 200 μL/min. API, positive ion mode, MRM acquisition mode. Retention time: 11.7 min. Limit of quantification, 0.1 μg/L [Kintz *et al.* 2005].

Hair LC-MS Column: XTerra MS C₁₈ (100 × 2.1 mm i.d., 3.5 μm). Mobile phase: acetonitrile:0.1% formic acid (5:95 to 80:20 at 10 min), flow rate 200 μL/min. API, positive ion mode, MRM acquisition mode. Retention time: 11.7 min. Limit of quantification, 5 ng/g [Villain *et al.* 2005].

Disposition in the Body Rapidly absorbed after oral administration. Extensively metabolised by *N*-demethylation and hydroxylation. Urinary metabolites include 3-hydroxytetrazepam, 3-hydroxydesmethyltetrazepam, 3'-hydroxytetrazepam, and 3'-hydroxydesmethyltetrazepam. Tetrazepam is also metabolised to diazepam and further to nordazepam, the former being subject to CYP 3A4 metabolism [Pavlic *et al.* 2007].

Therapeutic Concentration

After a single oral dose of 50 mg to 12 subjects, peak serum concentrations of 0.49–0.63 mg/L (mean 0.57) of tetrazepam and 0.005–0.008 mg/L of desmethyltetrazepam were attained in about 2 h and 4 h respectively [Baumgärtner *et al.* 1984].

Half-life Plasma half-life, 10–25 h (mean 15).

Dose 25 to 150 mg daily.

Tetrodotoxin

Natural Toxin, Pyrimidinyl Alcohol, Sodium Channel Blocker

C₁₁H₁₇N₃O₈ = 319.3

CAS—4368-28-9

IUPAC Name Octahydro-12-(hydroxymethyl)-2-imino-5,9,7,10a-dimethano-10aH-[1,3]dioxocino[6,5-d]pyrimidine-4,7,10,11,12-pentol

Synonyms Arareigai toxin; fugu poison; maculotoxin; spheroidine; tarichatoxin; tetradonic acid; tetradontoxin; TTX.

Chemical Properties Found mainly in certain organs (ovaries and liver) of the puffer fish of the genus *Fugu* along with a number of other forms of sea and freshwater animals (e.g. globe fish, *Spheroides rubripres*). The toxin is not made by the fish but appears to be made by relatively common marine bacteria, specifically *Pseudoalteromonas haloplanktis tetrodonis* that associates with these animals. Darkens above 220° without decomposition. Soluble in dilute acetic acid; slightly soluble in water, dry alcohol and ether. Practically insoluble in other organic solvents. Toxin destroyed in strong acids and in alkaline solutions. pK_a 8.76 [O'Neil *et al.* 2006].

Mass Spectrum Principal ions at *m/z* 392, 73, 407, 376, 318 (tri-TMS derivative).

Quantification

Blood GC-MS Column: HP-1 (30 m × 0.25 mm i.d.). Carrier gas: He, 1.0 mL/min. Temperature programme: 165° to 230° at 3°/min. EI ionisation at 70 eV. Retention time: C₉ base-TMS derivative 20.8 min. Limit of quantification not reported [Tsai *et al.* 2006].

LC-MS Column: Zorbax 300SB-C3 (150 × 4.6 mm i.d.). Mobile phase: 1% acetonitrile:10 mmol/L trimethylamine:10 mmol/L ammonium formate (pH 4.0), flow rate 0.4 mL/min. ESI, positive ion mode. Limit of detection, 15.6 nmol/L [Tsai *et al.* 2006].

Serum TLC Stationary phase: quartz rods coated with silica gel. Mobile phase: *n*-butanol:acetic acid:water (60:15:30). FID. R_f 0.40. Limit of detection, 0.04 mg/L [Ikebuchi *et al.* 1988].

GC-MS Column: glass with 1.5% OV-17 on 60–80 mesh Chromosorb W (1 m × 30 mm i.d.). Carrier gas: He, 30 mL/min. EI ionisation at 70 eV. Retention time: C₉ base-TMS derivative 1.8 min. Limit of quantification, 0.01 mg/kg [Moriya *et al.* 1992].

HPLC Column: NovaPak C₁₈ (100 × 8.0 mm i.d., 4 μm). Mobile phase: 5 mmol/L heptanesulfonic acid-3% acetonitrile in water (pH 4.5), flow rate 0.3 mL/min. Post-column derivatisation with 4 mol/L sodium hydroxide. Fluorescence detection (λ_{ex} = 380 nm, λ_{em} = 505 nm). Retention times: TTX 18 min, anhydroTTX 19 min. Limit of quantification, 5 μg/L [O'Leary *et al.* 2004].

LC-MS Column: Shodex RSPak NN-414 (150 × 4.6 mm i.d.). Mobile phase: 20 mmol/L ammonium acetate (pH 6.8):acetonitrile (90:10), flow rate 0.6 mL/min. ESI, positive ion mode, SIM acquisition mode. Retention time: 18.6 min. Limit of quantification, not reported [Hayashida *et al.* 2003].

Urine TLC Stationary phase: quartz rods coated with silica gel. Mobile phase: *n*-butanol:acetic acid:water (60:15:30). FID. R_f 0.40. Limit of detection, 0.04 μg/mL [Ikebuchi *et al.* 1988].

GC-MS Column: HP-1 (30 m × 0.25 mm i.d.). Carrier gas: He, 1.0 mL/min. Temperature programme: 165° to 230° at 3°/min. EI ionisation at 70 eV. Retention time: C₉ base-TMS derivative 20.8 min. Limit of quantification not reported [Tsai *et al.* 2006]. Column: glass with 1.5% OV-17 on 60–80 mesh Chromosorb W (1 m × 30 mm i.d.). Carrier gas: He, 30 mL/min. EI ionisation at 70 eV. Retention time: C₉ base-TMS derivative 1.8 min. Limit of quantification, 0.01 μg/g [Moriya *et al.* 1992].

HPLC Column: NovaPak C₁₈ (100 × 8.0 mm i.d., 4 μm). Mobile phase: 5 mmol/L heptanesulfonic acid 3% acetonitrile in water (pH 4.5), flow rate 0.3 mL/min. Post-column derivatisation with 4 mol/L sodium hydroxide. Fluorescence detection (λ_{ex} = 380 nm, λ_{em} = 505 nm). Retention times: TTX 18 min, anhydroTTX 19 min. Limit of quantification, 20 μg/L [O'Leary *et al.* 2004]. Column: Zorbax 300SB-C3 (150 × 4.6 mm i.d.). Mobile phase: 1% acetonitrile:10 mmol/L trimethylamine:10 mmol/L ammonium formate (pH 4.0), flow rate 0.4 mL/min. ESI, positive ion mode. Limit of detection, 15.6 nmol/L [Tsai *et al.* 2006].

Stomach Contents GC-MS Column: glass with 1.5% OV-17 on 60–80 mesh Chromosorb W (1 m × 30 mm i.d.). Carrier gas: He, 30 mL/min. EI ionisation at 70 eV. Retention time: C₉ base-TMS derivative 1.8 min. Limit of quantification, 0.01 μg/g [Moriya *et al.* 1992].

Other TLC Puffer Fish. Plates: precoated silica gel. Solvent system: methanol:acetic acid (96:4). UV detection (λ = 365 nm) after spraying with 10% potassium hydroxide solution. Limit of quantification not reported [Wu *et al.* 2005]. Gastropods (*Zeuxis samiplicutus*). Plates: precoated silica gel 60F₂₅₄ (5 × 20 cm, 2 mm thickness). Solvent system: pyridine:ethylacetate:acetic acid:water (15:5:3:4). UV detection (λ = 365 nm) after spraying with 10% potassium hydroxide and heating at 110° for 10 min. R_f 0.62. Limit of quantification not reported [Sui *et al.* 2002].

HPLC Blue-ringed Octopus (*Hapalochlaena maculosa*) and Puffer Fish (*Fugu pardalis*). Column: Develosil C30 UG-5 (250 × 4.6 mm i.d., 5 μm). Mobile phase: 1% acetonitrile:30 mmol/L ammonium heptafluorobutyrate:10 mmol/L ammonium formate (pH 5.0), flow rate 0.4 mL/min. Post-column derivatisation with 4 mol/L sodium hydroxide. Fluorescence detection (λ_{ex} = 365 nm, λ_{em} = 510 nm). Limit of quantification not reported [Jang, Yotsu-Yamashita 2006; Yotsu-Yamashita *et al.* 2007]. Freshwater Puffer Fish (*Colomesus asellus*). Column: C₁₈ (250 × 4.6 mm i.d.). Mobile phase: 60 mmol/L heptanesulfonic acid:10 mmol/L ammonium phosphate buffer (pH 5.0). Post-column derivatisation with 4 mol/L sodium hydroxide at 110°. Fluorescence detection (λ_{ex} = 380 nm, λ_{em} = 500 nm). Limit of detection, 0.1 μg/L [Oliveira *et al.* 2006]. Gastropods (*Z. samiplicutus*, *S. japonica*) and Goby (*Yongeichthys nebulosus*). Column: C₁₈ (200 × 4.0 mm i.d.). Mobile phase: 2 mmol/L 1-heptane sulfonate in methanol:0.05 mol/L potassium

phosphate (pH 7.0; 1:99). Post-column derivatisation with 3 N sodium hydroxide (1:1) and heating at 99° for 0.4 min. Fluorescence detection ($\lambda_{\text{ex}} = 381 \text{ nm}$, $\lambda_{\text{em}} = 505 \text{ nm}$). Retention times: TTX 11 min, anhydroTTX 14.5 min. Limit of quantification not reported [Lin *et al.* 1999; Sui *et al.* 2002]. Gastropods and Goby. Column: C₁₈ (250 × 4.6 mm i.d., 5 μm). Mobile phase: 2 mmol/L heptanesulfonic acid in 0.05 mol/L potassium phosphate buffer (pH 7.0), flow rate 0.5 mL/min. Post-column derivatisation with 4 mol/L sodium hydroxide (1:1). Fluorescence detection ($\lambda_{\text{ex}} = 381 \text{ nm}$, $\lambda_{\text{em}} = 505 \text{ nm}$). Retention times: TTX 13.0 min, anhydroTTX 16.5 min. Limit of detection, 0.2 $\mu\text{g/g}$ [Chen *et al.* 2002]. Puffer Fish Tissue. Column: C₁₈ (250 × 4.6 mm i.d., 5 μm). Mobile phase: 3% acetonitrile: 0.045 mol/L ammonium heptafluorobutyrate: 0.05 mol/L ammonium acetate buffer (pH 5.0). Post-column derivatisation with 4 mol/L sodium hydroxide at 105°. Fluorescence detection ($\lambda_{\text{ex}} = 365 \text{ nm}$, $\lambda_{\text{em}} = 510 \text{ nm}$). Limit of detection, TTX 0.2 $\mu\text{g/g}$, 4-*epi*TTX 0.3 $\mu\text{g/g}$, 4,9-anhydroTTX 0.4 $\mu\text{g/g}$ [Nuñez-Vázquez *et al.* 2000].

LC-MS Puffer Fish (*F. poecilonotus*) Eggs, Newt (*Cynops ensicauda*) Skin and Puffer Fish (*Fugu pardalis*) Tissues. Column: TSKgel Amide-80 (150 × 2.0 mm i.d., 5 μm). Mobile phase: 16 mmol/L ammonium formate buffer (pH 5.5): acetonitrile (3:7), flow rate 0.2 mL/min. ESI, positive ion mode, SIM acquisition mode. Retention times: TTX 16.3 min, 5,6,11-trideoxyTTX 5.6 min, 5-deoxyTTX 10.3 min, 11-deoxyTTX 11.0 min, 4,9-anhydroTTX 11.4 min, 11-norTTX-6(S)-ol 12.8 min, tetrodonic acid 13.4 min, 4-*epi*TTX 14.5 min, 11-norTTX-6(R)-ol 16.6 min, 6-*epi*TTX 17.8 min. Limit of detection, 10 pmol/L [Jang, Yotsu-Yamashita 2006; Nakagawa *et al.* 2006]. Mouse Serum. Column: Shodex RSpak NN-414 (150 × 4.6 mm i.d.). Mobile phase: 20 mmol/L ammonium acetate (pH 6.8): acetonitrile (90:10), flow rate 0.2 mL/min. ESI, positive ion mode, SIM acquisition mode. Retention time: 18.6 min. Limit of quantification, 1 $\mu\text{g/L}$; limit of detection, 0.5 $\mu\text{g/L}$ [Hayashida *et al.* 2004]. Puffer Fish Liver and Muscles. Column: Shodex RSpak NN-414 (150 × 4.6 mm i.d.). Mobile phase: 20 mmol/L ammonium acetate: methanol (75:25), flow rate 0.5 mL/min. ESI, positive ion mode, SIM acquisition mode. Retention time: 13.5 min. Limit of quantification, 0.01 mg/L [Horie *et al.* 2002]. Puffer Fish samples. Column: Develosil C30 UG-5 (250 × 4.6 mm i.d., 5 μm). Mobile phase: 1% acetonitrile: 20 mmol/L ammonium heptafluorobutyrate: 10 mmol/L ammonium formate (pH 4.0), flow rate 0.4 mL/min. ESI, positive ion mode, SIM acquisition mode. Retention times: TTX 17.4 min, 5-deoxyTTX 29.3 min, 11-deoxyTTX 22.5 min, 4,9-anhydroTTX 24.4 min, 11-norTTX-6(S)-ol 20.3 min, 4-*epi*TTX 21.3 min, 11-norTTX-6(R)-ol 23.5 min, 6-*epi*TTX 18.3 min. Limit of quantification, 50 pmol/L [Shoji *et al.* 2001].

Note A mouse bioassay of TTX has been developed and is the current Japanese official method. It defines one mouse unit (MU) as the amount of TTX required to kill a 20 g male mouse of the ddy strain in 30 min. One MU is presumed to be equivalent to 0.22 μg TTX [Horie *et al.* 2002]. For the detection of TTX in postmortem material by gas chromatography, see [Suenaga and Kotoku 1980].

Distribution in the Body

Toxicity TTX binds to the sodium channel of nerves, preventing the passage of sodium ions through the cell membrane and therefore the propagation of an action potential. Exposure typically comes from eating TTX-containing sea- and freshwater animals. Onset of symptoms occurs between 20 min and 3 h and include tingling, numbness, weakness, light-headedness, and limp paralysis, leading to dyspnoea, cyanosis, cardiac arrhythmia, and death. There is no known antidote. LD₅₀ in mice 8.7 $\mu\text{g/kg}$ (IV), 10 $\mu\text{g/kg}$ (IP).

Detection of TTX from the urine (100 mL) of a poisoned patient was reported as 9.6 μg 1 day after ingestion of contaminated seafood. Five days later, the amount of TTX detected in 100 mL of urine had fallen to 0.6 μg . In another case, 0.8 μg TTX was detected in 100 mL urine 1 day after ingestion of contaminated seafood, which fell to 0.6 μg 2 days later. In a third case, TTX amounts in 100 mL urine were 7.4, 1.3, 0.6 and 0.7 μg at 1, 5, 6 and 7 days post-ingestion of contaminated seafood [Kawatsu *et al.* 1999].

Serum and urine concentrations for 7 patients with puffer fish poisoning were reported as follows:

Age (years)/sex	Serum TTX ($\mu\text{g/L}$)	Urine TTX ($\mu\text{g/L}$)
33/M	–	28
47/F	<5	258
39/M	<5	125
41/M	<5	132
35/F	<5	–
47/M	<5	199
50/M	5	143

Serum samples were collected in hospital \approx 24 h after ingestion. Urine samples were single collections and no information on total urine collected over a period of time was available [O'Leary *et al.* 2004].

Six fishermen were victims (including 1 death) of food poisoning from an unknown fish in central Taiwan Strait. Estimated fish ingested and TTX urine and blood levels were reported in 4 of the patients as follows:

Age (years)	Estimated fish (g)	Urine TTX (nmol/L)	Blood TTX (nmol/L)
45	90	325	40.6
44	70	190	21.1
49	100	344	28.6
38	15	47	4.5

Urine and blood specimens were collected \approx 10 h after ingestion. Urine levels were higher than blood levels, suggesting that TTX is easily metabolised and excreted in urine [Tsai *et al.* 2006].

A 54-year-old man, found dead 3 to 4 h after ingesting 2 small portions of liver and milt of a puffer fish had a stomach content of 0.053 $\mu\text{g/g}$ TTX. However, no toxin was detected in his urine or serum [Moriya *et al.* 1992].

Tetryzoline

Sympathomimetic

C₁₃H₁₆N₂ = 200.3

CAS—84-22-0

IUPAC Name 2-(1,2,3,4-Tetrahydronaphthalen-1-yl)-4,5-dihydro-1H-imidazole

Synonyms 4,5-Dihydro-2-(1,2,3,4-tetrahydro-1-naphthalenyl)-1H-imidazole; tetryzoline.

Chemical Properties A white crystalline powder. Soluble in water and chloroform. Log P (octanol/water) 3.7.

Tetryzoline Hydrochloride

C₁₃H₁₆N₂·HCl = 236.7

CAS—522-48-5

Proprietary Names Azoline; Caltheon; Constrictia; Demetil; Diabenyl T; Edolzine; Exrhinin; Mallazine; Octilia; Ophthalmin N; Optazine Fresh; Optizoline; Rhinopront; Stilla; Tetrasine; Tertrilin; Tyzine; Vasopos N; Visine; Vispring; V-Zoline; Yxin.

Chemical Properties A white crystalline powder. Mp about 256° to 257°, with decomposition. Soluble 1 in 3.5 of water and 1 in 7.5 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Colour Tests Aromaticity (method 2)—colourless/yellow; Liebermann's reagent—brown-orange.

Thin-layer Chromatography System TA— R_f 0.13; system TB— R_f 0.07; system TC— R_f 0.02; system TE— R_f 0.26; system TL— R_f 0.02; system TAE— R_f 0.05; system TAF— R_f 0.60 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 1833.

Ultraviolet Spectrum Aqueous acid—265 ($A_1^1=21a$), 272 nm. No alkaline shift.

Infrared Spectrum Principal peaks at wavenumbers 1600, 742, 1293, 1250, 763, 1500 cm^{-1} (tetryzoline hydrochloride, KBr disk).

Mass Spectrum Principal ions at m/z 200, 185, 199, 171, 44, 84, 71, 131.

Use Tetryzoline hydrochloride is used as a 0.1% nasal solution.

Thalidomide

Hypnotic, Immunosuppressant

$\text{C}_{13}\text{H}_{10}\text{N}_2\text{O}_4 = 258.2$

CAS—50-35-1

IUPAC Name 2-(2,6-Dioxopiperidin-3-yl)isoindole-1,3-dione

Synonyms 2-(2,6-Dioxo-3-piperidinyl)-1H-isoindole-1,3(2H)-dione; E-217; K-17; NSC-66847; talidomid.

Proprietary Name *Thalomid*

Chemical Properties A white crystalline powder. Mp 269° to 271°. Sparingly soluble in water, methanol, ethanol and acetone; practically insoluble in chloroform, ether and benzene; very soluble in dimethylformamide, dioxan and pyridine. Log *P* (octanol/water), 0.3. Stable in buffered non-extracted plasma and semen samples at room temperature for 24 h, following 3 freeze-thaw cycles and when stored at 4° for 24 h [Teo *et al.* 2002].

Ultraviolet Spectrum Aqueous acid—240 ($A_1^1=385b$), 300 nm ($A_1^1=94b$).

Infrared Spectrum Principal peaks at wavenumbers 1681, 727, 1205, 1250, 1316, 1110 cm^{-1} (Nujol mull).

Mass Spectrum Principal ions at m/z 76, 173, 104, 111, 148, 50, 169, 130.

Quantification

Blood HPLC Column: Chiralpak AD-RH (150 × 4.6 mm i.d.). Mobile phase: acetonitrile:methanol:0.025 mol/L citrate buffer (pH 3.0, 10:20:70), flow rate 0.5 mL/min. UV detection ($\lambda=220$ nm). Limit of quantification, 0.025 mg/L [Sembongi *et al.* 2008].

Plasma HPLC Column: BDS Hypersil (250 × 4.6 mm i.d., 5 μm). Mobile phase: 10 mmol/L ammonium acetate (pH 5.5):acetonitrile (75:25), flow rate 1.5 mL/min. UV detection ($\lambda=220$ nm). Limit of detection, 0.05 mg/L [Saccomanni *et al.* 2008]. Column: Spherisorb ODS-II (100 × 5 mm i.d., 5 μm). Mobile phase: methanol:acetonitrile (4:1) 29.2% in water, flow rate 3.0 mL/min. UV detection ($\lambda=225$ nm). Limit of detection, 0.2 mg/L [Boughton *et al.* 1995].

LC-MS Column: ODS C_{18} (35 × 3.2 mm i.d., 3 μm). Mobile phase: water:acetonitrile:acetic acid (75:25:0.1), flow rate 0.5 mL/min. APCI, negative ion mode. Limit of quantification, 7 $\mu\text{g/L}$ [Teo *et al.* 2002].

Serum HPLC Column: Chirobiotic V (250 × 4 mm i.d.). Mobile phase: acetonitrile:20 mmol/L ammonium formate (pH 5.4, 14:86), flow rate 1.0 mL/min. UV detection ($\lambda=220$ nm). Limit of quantification, 0.05 mg/L for thalidomide enantiomers [Murphy-Poulton *et al.* 2006]. Column: Supelco C_{18} (125 × 4.6 mm i.d., 5 μm). Mobile phase: 0.01 mol/L potassium dihydrogen phosphate (pH 3.0):methanol (25:75), flow rate 1.5 mL/min. DAD ($\lambda=220$ nm). Limit of quantification, 0.222 mg/L [Torano *et al.* 1999]. Column: LiChrosorb RP-8 (125 × 4.6 mm i.d., 5 μm) or Spherisorb S5 C_{18} (126 × 4.6 mm i.d.). Mobile phase: water:methanol:propan-1-ol (180:30:20), flow rate 0.9 mL/min or water:acetonitrile (80:20), flow rate 1.5 mL/min. UV detection, ($\lambda=254$ or 290 nm). Limit of detection, 1 mg/L [Czejka, Koch 1987].

Semen LC-MS See Plasma. Limit of quantification, 8 ng/g [Teo *et al.* 2002].

Tissues HPLC See Serum [Murphy-Poulton *et al.* 2006].

Disposition in the Body Thalidomide is absorbed from the gastrointestinal tract. It is hydrolysed in the body, forming mainly 2-(*o*-carboxybenzamido)glutaramide, although many other hydrolysis products are also detectable.

Therapeutic Concentration

Forty-five patients with refractory multiple myeloma were treated with 100 mg thalidomide daily for 1 week, then with 200 mg daily. Mean plasma thalidomide trough concentrations were 0.343 and 0.875 mg/L on the third day after treatment with 100-mg and 200-mg doses, respectively [Kodama *et al.* 2009].

Patients with erythema nodosum leprosum treated with 100 mg thalidomide daily had plasma levels of 0.82–1.03 mg/L during treatment [Vieira, Valente 2009].

Peak levels of 1.15 mg/L were achieved in healthy subjects at 4.39 h after a single dose of 200 mg thalidomide [Chen *et al.* 1989].

Toxicity Thalidomide has a low acute toxicity; in 2 cases of reported overdose there was no evidence of respiratory or cardiac depression. Thalidomide has teratogenic effects when administered to women early in pregnancy.

Half-life Absorption half-life 1.7 h. Elimination half-life reported as 7.3 h and 8.7 h [Chung *et al.* 2004].

Volume of Distribution 120.7 L [Chen *et al.* 1989].

Clearance Renal clearance 0.08 L/h (0.6% of dose); therefore, major route of elimination is non-renal [Chen *et al.* 1989].

Note For a review of the clinical pharmacokinetics of thalidomide, see Teo *et al.* [2002].

Dose Thalidomide 50 to 400 mg daily in the treatment of lepra reactions; up to 800 mg daily in the treatment of multiple myeloma.

Thebacon

Narcotic Analgesic

$C_{20}H_{23}NO_4 = 341.4$

CAS—466-90-0

Synonyms Acetylhydrocodone; acetyldihydrocodeinone; (5 α)-6,7-didehydro-4,5-epoxy-3-methoxy-17-methylmorphinan-6-ol acetate; dihydrocodeinone enol acetate.

Chemical Properties White powder. Mp 154°. Practically insoluble in water; soluble in ethanol, chloroform and ether. Log *P* (octanol/water), 2.4.

Thebacon Hydrochloride

$C_{20}H_{23}NO_4 \cdot HCl = 377.9$

CAS—20236-82-2

Proprietary Name *Acedicone*

Chemical Properties White crystals. Mp 132° to 135°, with decomposition. Soluble in water.

Colour Test Marquis test—yellow→violet.

Thin-layer Chromatography System TA—*R_f* 0.45; system TB—*R_f* 0.20; system TC—*R_f* 0.34; system TE—*R_f* 0.49; system TL—*R_f* 0.11; system TAE—*R_f* 0.24; system TAF—*R_f* 0.25 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2533; system GB—RI 2559. Also metabolised to dihydrocodeine.

High Performance Liquid Chromatography System HA—*k* 3.7 (tailing peak); system HC—*k* 0.85; system HX—RI 333.

Ultraviolet Spectrum Aqueous acid—281 nm ($A_1^1 = 41b$).

Infrared Spectrum Principal peaks at wavenumbers 1208, 1138, 1744, 1500, 905, 1194 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 341, 298, 43, 44, 55, 284, 242.

Dose Usually 10 mg of thebacon hydrochloride daily.

Thebaine

Alkaloid

$C_{19}H_{21}NO_3 = 311.4$

CAS—115-37-7

Synonyms Paramorphine; (5 α)-6,7,8,14-tetrahydro-4,5-epoxy-3,6 dimethoxy-17-methylmorphinan.

Chemical Properties An alkaloid present in opium. A white powder. Mp 193°. Soluble 1 in 1460 of water, 1 in about 15 of hot ethanol, 1 in 13 of chloroform, 1 in 200 of ether and 1 in 25 of benzene. *pK_a* 6.1 (15°); 8.2 (20°). Log *P* (octanol/buffer pH 7.5), 0.3; (octanol/water), 2.0.

Colour Tests Mandelin's test—orange→brown; Marquis test—red→orange.

Thin-layer Chromatography System TA—*R_f* 0.45; system TB—*R_f* 0.24; system TC—*R_f* 0.37; system TE—*R_f* 0.45; system TL—*R_f* 0.05; system TAE—*R_f* 0.23; system TAF—*R_f* 0.32; system TAJ—*R_f* 0.22; system TAK—*R_f* 0.11; system TAL—*R_f* 0.76 (Dragendorff spray, positive; FPN reagent, faint brown; acidified iodoplatinate solution, positive; Marquis reagent, yellow).

Gas Chromatography System GA—RI 2517.

High Performance Liquid Chromatography System HA—*k* 4.6 (tailing peak); system HC—*k* 0.9; system HS—*k* 0.80; system HX—RI 340; system HY—RI 276.

Ultraviolet Spectrum Aqueous acid—284 nm ($A_1^1 = 253a$). No alkaline shift.

Infrared Spectrum Principal peaks at wavenumbers 1234, 1605, 1144, 1270, 1030, 910 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 311, 255, 42, 44, 296, 310, 312, 174.

Quantification

Urine GC-MS Limit of detection, 2 to 81 $\mu\text{g/L}$ [Cassella *et al.* 1997].

Hair GC-MS Thebaine and drugs of abuse [Achilli *et al.* 1996].

Achilli G *et al.* (1996). Determination of illicit drugs and related substances by high-performance liquid chromatography with an electrochemical coulometric-array detector. *J Chromatogr A* 729: 273-277.

Thenalidine

Antihistamine

$\text{C}_{17}\text{H}_{22}\text{N}_2\text{S} = 286.4$

CAS—86-12-4

IUPAC Name 1-Methyl-N-phenyl-N-(thiophen-2-ylmethyl)piperidin-4-amine

Synonyms Thenaldine; thenophenopiperidine; thenopiperidine.

Chemical Properties Mp 95° to 97°. Practically insoluble in water; soluble in chloroform. Log *P* (octanol/water), 3.9.

Thenalidine Tartrate

$\text{C}_{17}\text{H}_{22}\text{N}_2\text{S}_2\text{C}_4\text{H}_6\text{O}_6 = 436.5$

CAS—16509-35-6

Chemical Properties A white crystalline powder. Mp 170° to 172°. Soluble in water.

Colour Tests Mandelin's test—orange→brown; Marquis test—grey-violet.

Thin-layer Chromatography System TA— R_f 0.50; system TB— R_f 0.38; system TC— R_f 0.44; system TE— R_f 0.52; system TL— R_f 0.12; system TAE— R_f 0.20 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2318.

High Performance Liquid Chromatography System HA— k 3.5.

Ultraviolet Spectrum Aqueous acid—234 nm ($A_1=280b$).

Infrared Spectrum Principal peaks at wavenumbers 1505, 748, 1600, 693, 1279, 755 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 97, 70, 99, 43, 98, 44, 42, 188.

Dose Thenalidine tartrate has been given in doses of 100 to 150 mg daily.

Thenium Closilate

Anthelmintic (Veterinary)

$\text{C}_{21}\text{H}_{24}\text{ClNO}_4\text{S}_2 = 454.0$

CAS—16776-64-0 (thenium); 4304-40-9 (closilate)

IUPAC Name 4-Chlorobenzenesulfonate; dimethyl-(2-phenoxyethyl)-(thiophen-2-ylmethyl)azanium

Synonyms 611CSS; *N,N*-dimethyl-*N*-(2-phenoxyethyl)-2-thiophenemethanaminium salt with 4-chlorobenzenesulfonic acid (1:1); thenium closylate.

Chemical Properties A white crystalline powder. Mp 159° to 160°. Soluble 1 in 200 of water, 1 in 25 of ethanol and 1 in 35 of chloroform.

Colour Tests Mandelin's test—green; Marquis test—violet.

Thin-layer Chromatography System TA— R_f 0.02 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—268 ($A_1=45b$), 275 nm ($A_1=36b$).

Infrared Spectrum Principal peaks at wavenumbers 1210, 1174, 1042, 1135, 760, 1010 cm^{-1} (KBr disk).

Thenyldiamine

Antihistamine

$\text{C}_{14}\text{H}_{19}\text{N}_3\text{S} = 261.4$

CAS—91-79-2

IUPAC Name *N,N*-Dimethyl-*N'*-pyridin-2-yl-*N'*-(thiophen-3-ylmethyl)ethane-1,2-diamine

Chemical Properties A liquid. Practically insoluble in water; soluble in chloroform. pK_a 3.9, 8.9 (25°). Log *P* (octanol/water), 2.6.

Thenyldiamine Hydrochloride

$\text{C}_{14}\text{H}_{19}\text{N}_3\text{S}\cdot\text{HCl} = 297.8$

CAS—958-93-0

Proprietary Names It is an ingredient of *Asafen*, *NTR* and *Sinefricol*.

Chemical Properties A white crystalline powder. Mp about 170°. Soluble 1 in 5 of water, 1 in 5 of ethanol and 1 in 5 of chloroform; practically insoluble in ether.

Colour Tests Mandelin's test—green; Marquis test—black→violet.

Thin-layer Chromatography System TA— R_f 0.53; system TL— R_f 0.12; system TB— R_f 0.42; system TC— R_f 0.25; system TE— R_f 0.65; system TAE— R_f 0.21; system TAF— R_f 0.36 (Dragendorff spray, positive; Acidified iodoplatinate solution, positive; Marquis reagent, violet).

Gas Chromatography System GA—RI 1999; system GB—RI 2034; system GC—RI 2300; system GF—RI 2340.

High Performance Liquid Chromatography System HA— k 4.0; system HX—RI 317.

Ultraviolet Spectrum Aqueous acid—239 ($A_1^1=703a$), 315 nm; aqueous alkali—246, 310 nm.

Infrared Spectrum Principal peaks at wavenumbers 1597, 766, 1242, 976, 1159, 1311 cm^{-1} .

Mass Spectrum Principal ions at m/z 58, 97, 72, 71, 203, 191, 190, 42.

Dose Theophylline hydrochloride has been given in doses of up to 90 mg daily.

Theobromine

Xanthine Derivative

$\text{C}_7\text{H}_8\text{N}_4\text{O}_2 = 180.2$

CAS—83-67-0

IUPAC Name 3,7-Dimethylpurine-2,6-dione

Synonyms 3,7-Dihydro-3,7-dimethyl-(1*H*)-purine-2,6-dione; 3,7-dimethylxanthine; santheose; theobrominum.

Proprietary Names It is an ingredient of *Asthma-Hilfe*, *Propyre T* and *Urodonal*.

Chemical Properties An alkaloid contained in the seeds of *Theobroma cacao* (Sterculiaceae). A white microcrystalline powder which sublimes at 290° to 295°. Soluble 1 in 2000 of water, 1 in 2220 of 95% ethanol and 1 in 6000 of chloroform; almost insoluble in benzene, carbon tetrachloride and ether; freely soluble in dilute mineral acids and aqueous solutions of alkali hydroxides. $\text{p}K_a < 1$, 10.0 (25°). Log *P* (octanol/water), -0.8. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

Colour Test Amalic acid test—yellow/violet.

Thin-layer Chromatography System TA— R_f 0.53; system TB— R_f 0.01; system TC— R_f 0.31; system TE— R_f 0.34; system TF— R_f 0.04; system TG— R_f 0.47; system TL— R_f 0.21; system TAE— R_f 0.59; system TAF— R_f 0.54; system TAJ— R_f 0.32; system TAK— R_f 0.08; system TAL— R_f 0.65 (Ludy Tenger reagent, orange).

Gas Chromatography System GA—RI 1807; system GB—RI 1920.

High Performance Liquid Chromatography System HA— k 0.11; system HX—RI 262; system HY—RI 201; system HZ—retention time 1.6 min; system HAA—retention time 3.8 min.

Ultraviolet Spectrum Aqueous acid—272 nm ($A_1^1=563a$); aqueous alkali—274 nm.

Infrared Spectrum Principal peaks at wavenumbers 1690, 1665, 1221, 1550, 1595, 680 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 180, 55, 67, 109, 82, 42, 137, 70; 166, 68, 95, 41, 53, 123, —, — (3-methylxanthine); 166, 68, 123, 53, 42, 41, 95, — (7-methylxanthine).

Disposition in the Body Well absorbed after oral administration. It is metabolised by demethylation, mainly to 7-methylxanthine, together with some 3-methylxanthine. The 7-methylxanthine is further oxidised to 7-methyluric acid. About 90% of a dose is excreted in the urine in 48 h, of which ≈40% is 7-methylxanthine, 20% is 3-methylxanthine, 11% is 7-methyluric acid and 15% is unchanged drug. An additional metabolite, 6-amino-5-(*N*-methylformylamino)-1-methyluracil, accounts for ≈7% of a dose.

Theobromine is a metabolite of caffeine.

Half-life Plasma half-life, 5–11 h (mean, 8) after a single dose, increased on chronic administration.

Volume of Distribution About 0.5–1 L/kg.

Clearance Plasma clearance, about 0.8 mL/min/kg.

Saliva Plasma : saliva ratio, ≈1.0.

Dose 300 to 600 mg.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.

Theophylline

Xanthine Bronchodilator

C₇H₈N₄O₂ = 180.2

CAS—58-55-9

IUPAC Name 1,3-Dimethyl-7H-purine-2,6-dione

Synonyms Anhydrous theophylline; 3,7-dihydro-1,3-dimethyl-1H-purine-2,6-dione; 1,3-dimethylxanthine; teocina; teofilina; theophyllinum.

Proprietary Names *Accurbron*; *Aerolate*; *Aquaphyllin*; *Asmalix*; *Bronkodyl*; *Bronchoretard*; *Elixomin*; *Elixophyllin*; *Etheophyl*; *Euphyllin*; *Euphyllong*; *Lasma*; *Nuelin* (tablets); *Quibron-T*; *Respbid*; *Slo-Bid*; *Slo-Phyllin*; *Solosin*; *Sustaire*; *Teosona*; *Theo-24*; *Theobid*; *Theochron*; *Theoclear*; *Theo-Dur*; *Theograd*; *Theolair*; *Theon*; *Theospan*; *Theostat*; *Theovent*; *Theo-X*; *T-Phyl*; *Uni-Dur*; *Uniphyl*; *Uniphyllin Continus* (includes proprietary names of the hydrate). It is an ingredient of *Elixophyllin-GG*, *Elixophyllin-KI*, *Franol*, *Franol Plus*, *Franolyn Expectorant*, *Franyl*, *Glyceryl-T*, *Hydrophed*, *Marax*, *Neoasma*, *Quadrinal*, *Quibron*, *Slo-Phyllin GG*, *Tedrigen*, *Theodrine* and *Theomax DF*.

Chemical Properties A white crystalline powder. Mp 270° to 274°. Soluble 1 in 120 of water, 1 in 80 of ethanol and 1 in 110 of chloroform; sparingly soluble in ether; soluble in dilute acids, ammonia and alkali hydroxide solutions. pK_a < 1, 8.6 (25°). Log P (octanol/water), -0.02. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

Aminophylline

(C₇H₈N₄O₂)₂·C₂H₄(NH₂)₂·2H₂O = 456.5 (composition approximately corresponds to this formula)

CAS—317-34-0 (anhydrous)

IUPAC Name 1,3-Dimethyl-7H-purine-2,6-dione; ethane-1,2-diamine

Synonyms Euphyllinum; metaphyllin; theophyllaminum; theophylline and ethylenediamine; theophylline ethylenediamine compound.

Proprietary Names *Aminiodur*; *Aminocont*; *Aminomal*; *Amnivent*; *Cardophyllin*; *Clonofilin*; *Elixophyllin*; *Escophyllin*; *Euphyllin(a)*; *Filotempo*; *Mundiphyllin*; *Norphyllin SR*; *Pecram*; *Phyllocontin*; *Phyllotemp*; *Planphylline*; *Tefamin*; *Teofylamin*; *Triphylline*. It is an ingredient of *Emergent-Ez Mudrane*, *Mudrane GG*, *Mudrane GG-2* and *Theodrox*.

Chemical Properties A stable mixture containing 78–84% of anhydrous theophylline and 13–14% of ethylenediamine with a variable quantity of water. White or slightly yellowish granules or powder. Soluble 1 in 5 of water at 25°, but the addition of ethylenediamine or ammonia solution may be necessary to give complete solution. Practically insoluble in ethanol and ether.

Choline Theophyllinate

C₁₂H₂₁N₅O₃ = 283.3

CAS—4499-40-5

IUPAC Name 1,3-Dimethyl-2-oxopurin-6-olate; 2-hydroxyethyl(trimethyl)azanium

Synonyms Oxytrimeethyline; oxtriphylline; theophylline choline.

Proprietary Names *Brondecon Elixir*; *Choledyl*; *Euspirax*; *Rouphylline*; *Sabidal*; *Teovent*.

Chemical Properties A white crystalline powder. Mp 185° to 192°. Soluble 1 in <1 of water and 1 in 10 of ethanol; very slightly soluble in chloroform and ether.

Theophylline Hydrate

C₇H₈N₄O₂·H₂O = 198.2

CAS—5967-84-0

Synonym Theophylline monohydrate

Chemical Properties A white crystalline powder. Mp ~272°, after drying. Soluble 1 in 120 of water and 1 in 80 of ethanol; very slightly soluble in ether; soluble in solutions of alkali hydroxides.

Theophylline Monoethanolamine

C₇H₈N₄O₂·C₂H₇NO = 241.2

CAS—573-41-1

IUPAC Name 2-Aminoethanol; 1,3-dimethyl-7H-purine-2,6-dione

Synonyms Monotheamine; theophylline olamine.

Proprietary Names *Inophyllin*; *Teosona*.

Chemical Properties An equimolecular compound of anhydrous theophylline and monoethanolamine. A white crystalline powder. Soluble 1 in 20 of water.

Theophylline Sodium Glycinate

C₇H₇N₄NaO₂·C₂H₅NO₂ = 202.1 : 75.07 (=equimolecular proportions)

CAS—8000-10-0

IUPAC Name Sodium; 2-aminoacetate; 1,3-dimethyl-7H-purine-2,6-dione

Synonym Theophylline sodium aminoacetate

Proprietary Name *Nuelin* (liquid)

Chemical Properties An equilibrium mixture of theophylline sodium and glycine in approximately equimolecular proportions, buffered with an additional

1 mol glycine. A white crystalline powder. Soluble 1 in 6 of water; very slightly soluble in ethanol; practically insoluble in chloroform.

Colour Tests Amalic acid test—yellow/violet; Folin-Ciocalteu reagent—blue.

Thin-layer Chromatography System TA—R_f 0.75; system TB—R_f 0.01; system TC—R_f 0.30; system TE—R_f 0.11; system TF—R_f 0.09; system TG—R_f 0.33; system TL—R_f 0.11; system TAE—R_f 0.74; system TAF—R_f 0.66; system TAJ—R_f 0.40; system TAK—R_f 0.21; system TAL—R_f 0.78 (Ludy Tenger reagent—orange).

Gas Chromatography System GA—RI 2005; system GF—RI 2745.

High Performance Liquid Chromatography System HA—k 0.1; system HX—RI 276; system HY—RI 249; system HZ—RT 1.7 min; system HAA—RT 4.9 min; system HAM—RT 1.8 min; system HAX—RT 4.5 min; system HAY—RT 3.5 min.

Ultraviolet Spectrum Aqueous acid—270 nm (A₁¹ = 536a); aqueous alkali—275 nm (A₁¹ = 650a)

Infrared Spectrum Principal peaks at wave numbers 1670, 1717, 1567, 745, 980, 1190 cm⁻¹ (KBr disk)

Mass Spectrum Principal ions at m/z 180, 95, 68, 41, 53, 181, 96, 40 (theophylline); 166, 68, 95, 41, 53, 123, -, - (3-methylxanthine).

Quantification

Blood LC-MS Column: Luna ODS2 (75 × 4.6 mm i.d., 3 μm). Mobile phase: methanol: water (20:80), flow rate 0.5 mL/min. SIM acquisition mode. Limit of quantification, 12 μg/L [Watson *et al.* 2001].

Plasma TLC Plates: silica. Mobile phase: acetic acid:propan-2-ol:toluene (1:12:6). Limit of detection, 100 μg/L [Mirfazaelian *et al.* 2002]. Plate: silica gel 60 F254 (0.25 mm). Mobile phase: chloroform: methanol (9:1). UV detection (λ = 254 nm). R_f 0.54 Limit of quantification, 20 ng [Devarajan *et al.* 1999].

HPLC Column: Inertsil C₁₈ (150 × 4.6 mm i.d., 5 μm). Mobile phase: 10 mmol/L ammonium acetate buffer: methanol: acetonitrile (86:7:7), flow rate 1.0 mL/

min. UV detection ($\lambda=272$ nm). Limit of quantification, 100 $\mu\text{g/L}$ for theophylline and etophylline [Nirogi *et al.* 2007]. Column: TSK gel ODS-80 TM (150×4.6 mm i.d., 5 μm). Mobile phase: methanol: 0.01 mol/L phosphate buffer (pH 3.5, 30:70). UV detection ($\lambda=270$ nm). Limit of detection, 24.1 $\mu\text{g/L}$ [Emara 2004]. Column: ODS (150×6 mm i.d., 5 μm). Mobile phase: 5% acetic acid: acetonitrile-methanol (20:80, 80:20 for 10 min to 40:60 at 15 min to 20:80 at 20 min to 10:90 at 25 min), flow rate 1 mL/min. UV detection ($\lambda=280$ nm). Retention time: 8 min. Limit of quantification, 0.5 mg/L [Kamberi *et al.* 1999]. Column: ODS (250×4.6 mm i.d., 5 μm). Mobile phase: 0.01 mol/L acetate buffer (pH 4.0): methanol (91:9), flow rate 1.0 mL/min for 11 min to 1.5 mL/min for 6 min to 2.5 mL/min at 17 min for 13 min. UV detection ($\lambda=273$ nm). Limit of detection, 0.2 $\mu\text{mol/L}$ for theophylline and 0.1 $\mu\text{mol/L}$ for theophylline metabolites (1-methyluric acid, 3-methylxanthine, 1,3-dimethyluric acid) [Rasmussen, Brosen 1996]. Column: RP ODS-2 column packed with Spherisorb C_{18} (150×4.6 mm i.d., 5 μm), stainless steel. Mobile phase: acetonitrile: tetrahydrofuran: concentrated acetic acid: water (20:20:5:955), flow rate 1 mL/min. UV detection ($\lambda=273$ nm). Retention time: 5.0 min. Limit of detection, 0.1 mg/L [Schreiber-Deturmeny, Bruguerolle 1996].

LC-MS Column: C_{18} (150×3 mm i.d., 3 μm). Mobile phase: water-methanol (95:5): water-methanol (10:90), both containing 0.05% formic acid (100:0 to 20:80 in 3 min for 2 min to 100:0 at 6 min), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 24.4 $\mu\text{g/L}$ [Zhang *et al.* 2008]. Column: C_{18} (50×2.0 mm i.d., 3 μm). Mobile phase: methanol: 0.5 mL/L acetic acid (70:3), flow rate 0.25 mL/min. MRM acquisition mode. Limit of quantification, 0.0625 mg/L, limit of detection, 0.028 mg/L [Song *et al.* 2004]. Isotope dilution MS [Kress *et al.* 2002a].

Chemiluminescent assay Limit of quantification, 0.2 mg/L [Malliaros *et al.* 1997].

Serum GC Column: 2% SP 2510-DA or 2% SP 2110/1% SP 2510-DA on 100/120 mesh Supelcoport ($2 \text{ m} \times 4 \text{ mm}$ i.d.). Carrier gas: N_2 , 50 mL/min. Temperature programme: 25° to 250° at $2^\circ/\text{min}$. Limit of detection, 2.5 mg/L [Schwertner 1979].

GC-MS Column: DB-5MS ($30 \text{ m} \times 0.25 \text{ mm}$ i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 60° for 1 min to 300° at $20^\circ/\text{min}$ for 2 min. EI ionisation at 70 eV . SIM acquisition mode. Retention time: 11.03 min. Limit of detection, 1 ng [Saka *et al.* 2007].

HPLC Column: Nautilus C_{18} (150×4.6 mm i.d.). Mobile phase: 0.02 mol/L acetate: phosphate buffer (pH 3.0) containing 9.6% acetonitrile. UV detection ($\lambda=273$ nm). Theophylline and other substituted xanthines. Comparison with GC-IDMS [Kress *et al.* 2002b]. Column: ODS modified with CHAPS (3-[(3-cholamidopropyl)-dimethylammonio]-1-propanesulfonate). Mobile phase: 0.2 mmol/L sodium hydrogen phosphate (pH 7.4). UV detection ($\lambda=273$ nm). Limit of detection, 0.2 mg/L for theophylline and 0.5 mg/L for caffeine [Umemura *et al.* 1998].

LC-MS Column: XTerra MS C_{18} (150×2.1 mm i.d., 3.5 μm). Mobile phase: acetonitrile: 10 mmol/L ammonium acetate (pH 7.0, 2:98 for 15 min to 25:75 between 15 and 29 min until 50 min to 2:98 between 50 and 70 min), flow rate 0.15 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 0.5 mg/L [Hori *et al.* 2006]. See Plasma [Kress *et al.* 2002a].

Chemiluminescent assay See Plasma [Malliaros *et al.* 1997].

Urine HPLC Column: LiChrospher 100 RP-18 (244×4.4 mm i.d., 5 μm). Mobile phase: water: ethanol: acetic acid (75:24:1), flow rate 1.0 mL/min. UV detection ($\lambda=273$ nm). Limit of detection, 0.06 $\mu\text{g/L}$ for theophylline, 0.1 $\mu\text{g/L}$ for caffeine and 0.07 $\mu\text{g/L}$ for theobromine [de Arago *et al.* 2005]. Column: LC-18-DB. Mobile phase: methanol: 5 mmol/L citric acid buffer (pH 5, 20:80). UV detection. Theophylline, caffeine, theobromine and paraxanthine. Limit of quantification, 0.8 mg/L for theophylline, 1.2 mg/L for theobromine, limit of detection, 0.15 mg/L for theophylline, 0.3 mg/L for theobromine [Zamboni *et al.* 2004]. Column: Bondesil C_{18} . Mobile phase: methanol: water: acetic acid or ethanol: water: acetic acid (20:75:5), flow rate 0.7 mL/min. UV detection ($\lambda=273$ nm). Limit of detection, 0.1 mg/L for theophylline, caffeine and theobromine [Bispo *et al.* 2002]. See Serum [Kress *et al.* 2002a]. See Plasma. Mobile phase: (93:7). Limit of detection, 2 $\mu\text{mol/L}$ for theophylline and 1 $\mu\text{mol/L}$ for theophylline metabolites (1-methyluric acid, 3-methylxanthine, 1,3-dimethyluric acid) [Rasmussen, Brosen 1996]. Column: RP Ultrasphere-ODS (150×4.6 mm i.d., 5 μm). Mobile phase: 10 mmol/L sodium acetate: acetonitrile: tetrahydrofuran (96.9:3.0:0.1) containing 5 mmol/L tetrabutylammonium hydrogen sulfate (pH 4.7), flow rate 1.5 mL/min. UV detection ($\lambda=280$ nm). k value: 4.31 (RT, 8.5 min). Limit of detection, 1 mg/L for theophylline and 0.5 mg/L for theophylline metabolites [Tajerzadeh, Dadashzadeh 1995].

Disposition in the Body Orally administered aminophylline is readily absorbed, but absorption is less rapid for orally administered theophylline; there is irregular absorption after rectal administration. The presence of food or antacids does not affect absorption. Theophylline is rapidly and widely distributed throughout the tissues; unbound theophylline distributes into body water but poorly into body fat. It also passes freely across the placenta, into breast milk and into CSF. It is metabolised by N -demethylation to form 3-methylxanthine (which is active but less potent than theophylline), 1,3-dimethyluric acid and 1-methyluric acid (by further hydroxylation of 1-methylxanthine). Approximately 90% of a dose is metabolised in adults and children over 1 year of age; 6% to caffeine by N -methylation. In adults, ~13% of a dose is excreted in the urine in 24 h as unchanged drug, with approx. 15% as 3-methylxanthine, 35–50% as 1,3-dimethyluric acid and ~20% as 1-methyluric acid. In premature neonates, most of a dose is excreted as unchanged drug with up to 10% as caffeine. Theophylline is a metabolite of caffeine.

Therapeutic Concentration There is considerable inter-subject variation in serum theophylline concentrations; therapeutic effect has been correlated with concentrations of 10–15 mg/L. 3-Methylxanthine accumulates in the serum to concentrations of ~25% of those of theophylline. Diurnal variations in plasma concentrations have been reported, with higher concentrations in the morning. Steady-state concentrations are reached within 30–65 h (mean, 40) and levels reach 60% of the mean peak therapeutic concentration.

Eighteen healthy men, aged 20–30 years, were administered either a 1000 mg once daily dose in the evening (equivalent to 13 mg/kg) or two 500 mg doses in the morning and evening. Each dose was administered 30 min after a standard meal. The mean peak plasma concentration for the once daily dose was 15.2 mg/L (range, 11.9–19.4) on days 5/6 and 15.0 mg/L (range, 11.6–19.3) on days 8/9. For the twice daily dosing, the peak concentration was 11.8 mg/L (range, 9.0–15.3) on days 5/6 and 12.1 mg/L (range, 9.0–16.2) on days 8/9 [Gotz *et al.* 1994].

Twelve healthy, young, non-smoking men, aged 23 to 30 years, were administered a single oral dose of 200 mg theophylline in solution diluted with either water or grapefruit juice, after an overnight fast. The mean peak plasma concentration was 6.2 mg/L (range, 4.7–9.6) for the dose administered with the water and 5.6 mg/L (range, 4.2–7.8) for the dose with grapefruit, observed at 0.25–2.0 h and 0.5–1.5 h, respectively [Fuhr *et al.* 1995].

Twelve debilitated elderly patients were administered theophylline either orally (dose 360 mg daily) or via a nasogastric tube (320 mg daily, by means of emptying capsule contents and mixing with 10 mL of water; dose not significantly different from that given orally). Trough and peak levels in the nasogastric-tube group were 0.5–10.7 mg/L (mean, 3.7) and 1.3–13.3 mg/L (mean, 6.5), respectively, the time to reach peak concentration being 6.5 h. Trough and peak levels in the orally administered group were 0–15.61 mg/L (mean, 8.63) and 4.3–16.2 mg/L (mean, 10.5), respectively, with a time to peak concentration of 5.5 h [Berkovitch *et al.* 2002].

Toxicity The estimated minimum lethal dose after IV administration is 0.1 g; fatalities have occurred after oral doses of 8.4 mg/kg in a child and after 25–100 mg/kg aminophylline given as a suppository. Recovery has been reported after ingestion of choline theophyllinate equivalent to 12.8 g theophylline. Toxic effects are usually associated with plasma concentrations >30 mg/L, and fatalities with concentrations above 50 mg/L; premature neonates appear to be relatively resistant to theophylline poisoning. Premature neonates, patients with hepatic cirrhosis, the elderly and women during the third trimester of pregnancy may show toxic signs at serum concentrations in the therapeutic range, 10–20 mg/L, owing to an increase in unbound pharmacologically active drug.

A 50-year-old patient who attempted suicide with theophylline had peak levels of 148 mg/L [Shechter *et al.* 1996].

In a 44-year-old woman who was found dead next to an empty container of theophylline capsules (maximum possible dose ingested was 100 tablets of 350 mg), toxicological analysis revealed a serum theophylline concentration of 127 mg/L and a concentration of 154 mg/L in the fluid gathered from cutaneous blisters on regions exposed to pressure [Tsokos, Sperhake 2002].

A 17-year-old man was found dead the following morning after complaining of a headache the previous night, which he treated with 1 or 2 Panadol tablets (500 mg paracetamol). Postmortem toxicological analysis showed a serum theophylline concentration of 145 mg/L, liver 91 $\mu\text{g/g}$, urine 182 mg/L and vitreous humour 48 mg/L. A total of 320 mg and 3 part tablets were detected in the stomach contents. All tissue/fluid theophylline concentrations were at a fatal level [Ryall 1997].

Of 249 patients classed as having theophylline intoxication (defined as a peak serum concentration of 30 mg/L; 167 $\mu\text{mol/L}$), 119 had acute intoxication without having previously received theophylline therapy. These patients had a mean peak serum theophylline concentration of 375 $\mu\text{mol/L}$ (882 $\mu\text{mol/L}$ in 4 who died). In 38 patients who had acute intoxication while receiving theophylline therapy, the mean peak serum concentration was 381 $\mu\text{mol/L}$. In 92 patients who had intoxication caused by chronic overmedication, the mean peak serum level was 279 $\mu\text{mol/L}$ [Shannon 1993].

In a further 10-year prospective analysis involving 356 patients with serum theophylline levels >30 mg/L (167 $\mu\text{mol/L}$), the mean peak theophylline concentration was 336 $\mu\text{g/L}$. In this group, 162 and 144 had acute and chronic poisoning, respectively, and 50 had acute-on-therapeutic poisoning; 15 patients died, 11 of whom had chronic overmedication [Shannon 1999].

Half-life Plasma half-life, 3–13 h in normal subjects (mean, 7) but decreased in smokers and in children, and increased in premature neonates and in certain disease states such as hepatic disease, heart failure and chronic obstructive pulmonary disease. The half-life may also be affected by the amount of dietary methylxanthines ingested.

Volume of Distribution Approximately 0.5 L/kg; increases in premature neonates, patients with hepatic cirrhosis, the elderly and in women during the third trimester of pregnancy.

Clearance Plasma clearance, ~0.5–2 mL/min/kg in normal subjects; decreases by ~30% in the elderly and 50% in patients with hepatic impairment and congestive heart failure.

Distribution in Blood Plasma: whole blood ratio, 1.2.

Saliva Plasma: saliva ratio, ~2, but there is considerable inter-subject variation.

Protein Binding Approximately 40% (temperature and pH dependent); decreased in neonates and in subjects with hepatic cirrhosis.

Note For reviews of the clinical pharmacokinetics of theophylline, see Ogilvie [1978] and Haley [1983]; for a review of theophylline intoxication, see Stegeman, Jordans [1991].

Dose 0.18 to 1 g daily based on serum theophylline concentrations.

Chemical Properties Crystals. Mp 148° to 150°. Sparingly soluble in water; readily soluble in most organic solvents. Log *P* (octanol/water), 3.4.

Thialbarbital Sodium

C₁₃H₁₅N₂NaO₂S = 286.3
CAS-3546-29-0

Synonyms Sodium cyclohexenylallylthiobarbituricum; thiohexallylnatrium.

Chemical Properties A pale yellow hygroscopic powder. Mp 130° to 132°. Very soluble in water and ethanol; slightly soluble in chloroform; practically insoluble in ether.

Colour Tests Palladium chloride—orange-yellow; vanillin reagent—brown-orange/violet (transient).

Thin-layer Chromatography System TD—R_f 0.77; system TE—R_f 0.43; system TF—R_f 0.72; system TH—R_f 0.75; system TAD—R_f 0.69 (mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown; Zwickler's reagent, green).

Gas Chromatography System GA—RI 2116.

High Performance Liquid Chromatography System HX—RI 480.

Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—256, 307 nm (A₁¹=1236b); M sodium hydroxide (pH 13)—306 nm (A₁¹=1271b).

Infrared Spectrum Principal peaks at wavenumbers 1685, 1610, 1300, 1130, 1270, 1000 cm⁻¹ (thialbarbital sodium, KBr disk).

Mass Spectrum Principal ions at *m/z* 81, 223, 79, 41, 80, 157, 185, 77.

Dose Thialbarbital sodium has been given in doses of 0.2 to 1 g IV.

Thiamazole

Antithyroid Agent

C₄H₆N₂S = 114.2

CAS—60-56-0

IUPAC Name 3-Methyl-1H-imidazole-2-thione

Synonyms 1,3-Dihydro-1-methyl-2H-imidazole-2-thione; mercapozylum; methimazole; thiamazol.

Proprietary Names Favistan; Mercaptizol; Metibasol; Strumazol; Tapazol(e); Thacapzol; Thycazol; Thyrozol; Tirodril.

Chemical Properties A white to pale buff, crystalline powder. Mp 144° to 147°. Soluble 1 in 5 of water, 1 in 5 of ethanol and 1 in about 5 of chloroform;

Thialbarbital

Anaesthetic, Barbiturate

C₁₃H₁₆N₂O₂S = 264.3

CAS—467-36-7

IUPAC Name 5-Cyclohex-2-en-1-yl-5-prop-2-enyl-2-sulfanylidene-1,3-diazinane-4,6-dione

Synonyms 5-(2-Cyclohexen-1-yl) dihydro-5-(2-propenyl)-2-thioxo-4,6-(1H,5H)-pyrimidinedione; thialbarbitone.

freely soluble in acetone; sparingly soluble in ether, petroleum ether, and benzene. Log *P* (octanol/water), -0.3.

Colour Test Palladium chloride—orange.

Thin-layer Chromatography System TA—*R_f* 0.62; system TB—*R_f* 0.01; system TC—*R_f* 0.52; system TE—*R_f* 0.41; system TL—*R_f* 0.59; system TAE—*R_f* 0.80 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 1550.

Ultraviolet Spectrum Aqueous acid—252 nm (*A*₁¹=1505a).

Infrared Spectrum Principal peaks at wavenumbers 1570, 1271, 740, 1250, 765, 675 cm⁻¹ (KBr disk).

Mass Spectrum Principal ions at *m/z* 114, 42, 72, 113, 69, 81, 54, 115.

Quantification See under Carbimazole.

Disposition in the Body Absorbed after oral administration and widely distributed throughout the body. About 10% of a dose is excreted in the urine as unchanged drug. 3-Methyl-2-thiohydantoin has been identified in plasma and urine as a minor metabolite.

Thiamazole is the active metabolite of carbimazole.

Therapeutic Concentration

Following a single oral dose of 60 mg given to 11 subjects, peak serum concentrations of 0.5 to 2.5 mg/L (mean, 1.3) were attained in about 1 to 3 h [Melander *et al.* 1980].

Half-life Plasma half-life, about 3 to 5 h.

Volume of Distribution About 0.5 L/kg.

Protein Binding Not significantly bound.

Note For a review of the pharmacokinetics of antithyroid agents, see Kampmann and Hansen [1981].

Dose Initially, 15 to 60 mg daily; maintenance, 5 to 15 mg daily.

Kampmann JB, Hansen JM (1981). Clinical pharmacokinetics of antithyroid drugs. *Clin Pharmacokinet* 6: 401-428.

Melander A *et al.* (1980). Comparative in vitro effects and in vivo kinetics of antithyroid drugs. *Eur J Clin Pharmacol* 17: 295-299.

Thiambutosine

Antileprotic

C₁₉H₂₅N₃OS = 343.5

CAS—500-89-0

IUPAC Name 1-(4-Butoxyphenyl)-3-(4-dimethylaminophenyl)thiourea

Synonym DPT

Proprietary Name Ciba-1906

Chemical Properties A white or creamy-white crystalline powder. Mp 123° to 127°. Practically insoluble in water; soluble 1 in 1.5 of chloroform and 1 in 300 of ether; soluble in acetone.

Thin-layer Chromatography System TA—*R_f* 0.76; system TL—*R_f* 0.69; system TB—*R_f* 0.06; system TC—*R_f* 0.77.

Gas Chromatography System GA—RI 1715.

Ultraviolet Spectrum Ethanol—270 nm (*A*₁¹=720a).

Infrared Spectrum Principal peaks at wavenumbers 1234, 720, 1307, 1499, 813, 1093 cm⁻¹.

Mass Spectrum Principal ions at *m/z* 151, 109, 136, 178, 177, 29, 207, 135.

Disposition in the Body Thiambutosine is poorly absorbed after oral administration; aqueous suspensions are slowly and possibly incompletely absorbed after IM injection. About 10% of a dose is metabolised to water-soluble compounds and rapidly excreted in the urine; about 75% of a dose is eliminated unchanged in the faeces.

Dose 1 to 3 g daily.

Thiamine

Vitamin

C₁₂H₁₇ClN₄OS = 300.8

CAS—59-43-8

IUPAC Name 2-[3-[(4-Amino-2-methylpyrimidin-5-yl)methyl]-4-methyl-1,3-thiazol-3-ium-5-yl]ethanol chloride

Synonyms 3-[(4-Amino-2-methyl-5-pyrimidinyl)methyl]-5-(2-hydroxyethyl)-4-methylthiazolium chloride; aneurine; vitamin B₁.

Chemical Properties p*K_a* 4.8 (20°). Log *P* (octanol/water), -3.9.

Thiamine Hydrochloride

C₁₂H₁₇ClN₄OS, HCl = 337.3

CAS—67-03-8

Synonym Aneurine chloride hydrochloride

Proprietary Names *Benerva*; *Beneuran*; *Betabion*; *Betamin(e)*; *Beta-Sol*; *Betaxin*; *Bevitine*; *Bevitol*; *Bewon*; *Neuramin*; *Vita-B1*. It is an ingredient of *Labiton* and *Quiet Life*.

Chemical Properties Colourless crystals or white crystalline powder. Mp 248°, with decomposition. Soluble 1 in about 1 of water, 1 in 100 of 95% ethanol and 1 in 18 of glycerol; practically insoluble in dehydrated alcohol, benzene, hexane, chloroform and ether; soluble in methanol.

Thiamine Mononitrate

$C_{12}H_{17}N_5O_4S = 327.4$
CAS—532-43-4

Synonyms Aneurine mononitrate; thiamine nitrate; vitamin B₁ mononitrate.

Proprietary Name *B₁-Vicotrat*

Chemical Properties White crystals or crystalline powder. Mp 196° to 200°, with decomposition. Soluble 1 in 44 of water; slightly soluble in ethanol and chloroform.

Colour Test Dissolve about 5 mg of thiamine hydrochloride in a mixture of 1 mL of lead acetate solution and 1 mL of 10% sodium hydroxide solution—yellow; after heating on a steam-bath—brown; on standing—a black precipitate of lead sulfide.

Thin-layer Chromatography Thiamine hydrochloride: system TA—R_f 0.01; system TB—R_f 0.00; system TC—R_f 0.00; system TE—R_f 0.01; system TL—R_f 0.00; system TAE—R_f 0.02; system TAF—R_f 0.18 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—not eluted.

High Performance Liquid Chromatography System HA—*k* 2.0; system HX—RI 09 (hydrochloride); system HY—RI 21 (hydrochloride).

Ultraviolet Spectrum Aqueous acid—246 nm ($A_1^1=450a$); aqueous alkali—232 nm ($A_1^1=566b$), 336 nm.

Infrared Spectrum Principal peaks at wavenumbers 1660, 1618, 1048, 1237, 1595, 1228 cm^{-1} (thiamine hydrochloride, KBr disk).

Quantification

Plasma HPLC Fluorescence detection. Limit of detection, 150 ng/L [Weber, Kewitz 1985].

Disposition in the Body Well absorbed from the gastrointestinal tract and widely distributed throughout the body. It is converted in the body to thiamine pyrophosphate. Thiamine is not stored to any appreciable extent in the body and amounts in excess of the body's requirements are excreted in the urine unchanged or as metabolites. About 1 mg of thiamine is metabolised in the body daily.

Blood Concentration Endogenous blood concentrations are about 0.010 to 0.015 mg/L and concentrations of thiamine pyrophosphate in erythrocytes are usually 0.03 to 0.11 mg/L.

Endogenous plasma concentrations in 91 subjects ranged from 0.002 to 0.013 mg/L (median, 0.004) [Weber, Kewitz 1985].

Note For a general review of thiamine, see Inui and Nakano [1999].

Dose 10 to 100 mg daily.

Inui H, Nakano Y (1999). Vitamin B₁. *Nippon Rinsho* 57: 2187–2192.

Weber W, Kewitz H (1985). Determination of thiamine in human plasma and its pharmacokinetics. *Eur J Clin Pharmacol* 28: 213–219.

Thiamylal

Barbiturate

$C_{12}H_{18}N_2O_2S = 254.3$

CAS—77-27-0

IUPAC Name 5-Pentan-2-yl-5-prop-2-enyl-2-sulfanylidene-1,3-diazinane-4,6-dione

Synonym Dihydro-5-(1-methylbutyl)-5-(2-propenyl)-2-thioxo-4,6(1*H*,5*H*)-pyrimidinedione

Chemical Properties Crystals. Mp 132° to 133°. pK_a 7.5. Log *P* (octanol/water), 3.23.

Sodium Thiamylal

$C_{12}H_{17}N_2NaO_2S = 276.3$

CAS—337-47-3

Proprietary Name *Surital*

Chemical Properties Thiamylal sodium for injection is a mixture of sodium thiamylal with anhydrous sodium carbonate. It is a pale yellow hygroscopic powder. Soluble in water.

Thin-layer Chromatography System TE—R_f 0.55; system TF—R_f 0.75.

Gas Chromatography System GA—RI 1899.

Column: glass coil packed with 3% poly-A-103 on Gas Chrom Q (80–100 mesh) (0.5 m × 2.6 mm i.d.). Column and injector temperatures: 255° and 270°, respectively. Carrier gas: helium, flow rate 40 mL/min. IS: thiopental. MS detection (EI, SIM at *m/z* 184 for thiamylal and 172 for IS). Retention time: thiamylal, 1.2 min; IS, 1.1 min [Kudo *et al.* 1988].

High Performance Liquid Chromatography System HX—RI 516; system HY—RI 476.

Column: Chiral-AGP (100 × 4.0 mm i.d.); guard, Chiral-AGP (10 × 3.0 mm). Mobile phase: 20 mmol/L potassium dihydrogen phosphate containing 3% 2-propanol, pH 4.7, flow rate 0.9 mL/min. UV detection ($\lambda = 288$ nm). Retention time: R-(+)-thiamylal, 10.0 min; S-(-)-thiamylal, 11.7 min [Sueyasu *et al.* 1995].

Ultraviolet Spectrum Aqueous acid—238, 287 nm; aqueous alkali—305 nm.

Infrared Spectrum Principal peaks at wavenumbers 1668, 1541, 1731, 1170, 1318, 1291 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 43, 41, 184, 168, 167, 97, 55, 53.

Quantification

Serum HPLC UV detection ($\lambda = 288$ nm). Limit of quantification, 0.05 mg/L [Sueyasu *et al.* 1995].

Biological Samples GC-MS Limit of detection, 0.01 $\mu g/g$ [Kudo *et al.* 1988].

Disposition in the Body

Therapeutic Concentration

Six patients with liver dysfunction, aged 0.3 to 72 years, were IV administered with a total dose of 15.1 to 307.4 mg/kg (concentration of 25 or 50 g/L; infusion rate 0.45 to 4.0 mg/kg/h, over a period of 4.7 to 108.3 h). The unbound R-(+)-thiamylal serum concentration was 0.57 to 3.11 mg/L and the total concentration was 2.94 to 18.51 mg/L. The unbound S-(-)-thiamylal concentration was 0.78 to 3.74 mg/L and total 5.28 to 33.35 mg/L. All concentrations were observed after 10 min following administration [Sueyasu *et al.* 1997].

Toxicity

A fatal intoxication of IV thiamyl administration is reported. After toxicological analysis, thiamyl was detected in blood at a concentration of 129 mg/L; in liver 366 µg/g and in brain 116 µg/g. It was not detected in urine, gastric contents or bile [Stockham *et al.* 1991].

A 28-year-old student was found dead at his hotel room, hanging by his neck, and was IV connected to a bottle of thiamyl sodium. Thiamyl was detected at a concentration of 29 mg/L in blood, 1.4 mg/L in urine, 16 mg/L in bile and was present in liver at 135 µg/g, in kidney 25 µg/g and was present in his stomach contents at 0.4 mg. Alcohol and other drugs were not detected in the blood [Costantino *et al.* 1990].

Dose Initially 3 to 6 mL of a 2.5% solution of sodium thiamyl IV.

Thiazinamium Metilsulfate**Antihistamine**

$C_{19}H_{26}N_2O_4S_2 = 410.6$

CAS—2338-21-8 (thiazinamium); 58-34-4 (metilsulfate)

IUPAC Name Methyl sulfate; trimethyl(1-phenothiazin-10-ylpropan-2-yl)azanium

Synonyms Methylpromethazinium methylsulfuricium; RP-3554; *N,N,N*- α -tetramethyl-10*H*-phenothiazine-10-ethanaminium methyl sulfate; thiazinamium methylsulfate.

Proprietary Name *Multergan*

Chemical Properties A white crystalline powder which discolours on exposure to light. Mp 206° to 210°, with decomposition. Soluble 1 in 10 of water; very soluble in ethanol; practically insoluble in ether. Log *P* (octanol/water), 2.7.

Colour Tests Formaldehyde-Sulfuric acid—brown-violet; Forrest reagent—red; FPN reagent—red; Liebermann's reagent—red.

Thin-layer Chromatography System TA— R_f 0.02; system TAE—thiazinamium metilsulfate R_f 0.01, M (thiazinamium sulfoxide) R_f 0.00; system TAF— R_f 0.25; system TL— R_f 0.00; system TB—thiazinamium metilsulfate R_f 0.00, M (thiazinamium sulfoxide) R_f 0.00; system TC— R_f 0.00; system TE—thiazinamium metilsulfate R_f 0.00, M (thiazinamium sulfoxide) R_f 0.00; system TF—M (thiazinamium sulfoxide) R_f 0.00 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2339 Art (promethazine); system GB—RI 2383 Art (promethazine).

High Performance Liquid Chromatography System HX—RI 326 (M thiazinamium sulfoxide); system HZ—retention time 6.4 min.

Ultraviolet Spectrum Aqueous acid—251 ($A_1^1=450b$), 299 nm.

Infrared Spectrum Principal peaks at wavenumbers 1224, 1010, 1059, 764, 743, 1036 cm^{-1} .

Quantification

Plasma GC AFID. Limit of detection, 20 µg/L [Jonkman *et al.* 1975].

Urine GC See Plasma [Jonkman *et al.* 1975].

Disposition in the Body Thiazinamium metilsulfate is incompletely absorbed after oral administration and undergoes considerable first-pass metabolism to thiazinamium sulfoxide; it is well absorbed after IM administration. About 40% of a parenteral dose is excreted in the urine unchanged in 8 h, together with 9% of the dose as the sulfoxide.

Therapeutic Concentration

Following single oral doses equivalent to 300 mg and 900 mg of thiazinamium to 10 subjects, peak plasma concentrations of 0.03 to 0.13 (mean, 0.07) mg/L and 0.06 to 0.36 (mean, 0.17) mg/L were attained in about 2.4 h and 5 h, respectively [Jonkman *et al.* 1977].

Dose 0.6 to 1.2 g daily.

Jonkman JG *et al.* (1975). Determination of low concentrations of the quaternary ammonium compound thiazinamium methylsulphate in plasma and urine. *J Pharm Pharmacol* 27: 849–854.

Thiethylperazine**Antiemetic**

$C_{22}H_{29}N_3S_2 = 399.6$

CAS—1420-55-9

IUPAC Name 2-Ethylsulfanyl-10-[3-(4-methylpiperazin-1-yl)propyl]phenothiazine

Chemical Properties Crystals. Mp 62° to 64°. Practically insoluble in water. Log *P* (octanol/water), 5.4.

Thiethylperazine Malate

$C_{22}H_{29}N_3S_2 \cdot 2C_4H_6O_5 = 667.8$

CAS—52239-63-1

Proprietary Name *Torecan (injection)*

Chemical Properties A white to faintly yellow crystalline powder. Mp 139°. Soluble 1 in 40 of water, 1 in 90 of ethanol, 1 in 525 of chloroform and 1 in 3400 of ether.

Thiethylperazine Maleate

$C_{22}H_{29}N_3S_2 \cdot 2C_4H_4O_4 = 631.8$

CAS—1179-69-7

Proprietary Name *Torecan (suppositories and tablets)*

Chemical Properties A yellowish granular powder. Mp about 188° to 190°, with decomposition. Soluble 1 in 1700 of water and 1 in 530 of ethanol; practically insoluble in chloroform and ether.

Colour Tests Formaldehyde-Sulfuric acid—green; Forrest reagent—blue; FPN reagent—blue; Mandelin's test—violet; Marquis test—red→green.

Thin-layer Chromatography System TA— R_f 0.51; system TB— R_f 0.30; system TC— R_f 0.41; system TE—thiethylperazine R_f 0.52, M R_f 0.30; system TL— R_f 0.08; system TAE—thiethylperazine R_f 0.27, M R_f 0.13; system TAJ— R_f 0.22; system TAK— R_f 0.11; system TAL— R_f 0.83 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 3247.

High Performance Liquid Chromatography System HA—*k* 3.8; system HX—RI 487; system HZ—retention time 16.3 min.

Ultraviolet Spectrum Aqueous acid—255 ($A_1^1=857b$), 309 nm ($A_1^1=98b$).

Infrared Spectrum Principal peaks at wavenumbers 1563, 864, 1613, 1212, 1105, 1067 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 70, 113, 141, 399, 43, 26, 72, 42.

Quantification

Blood GC SID. Thiethylperazine and other phenothiazines. Limit of detection, 250 to 500 ng/L [Hattori *et al.* 1992].

HPLC Limit of detection, 0.5 µg/L [Seno *et al.* 1999].

Urine GC See Blood [Hattori *et al.* 1992].

Dose Usually 20 to 30 mg of thiethylperazine maleate daily.

Hattori H *et al.* (1992). Sensitive determination of phenothiazines in body fluids by gas chromatography with surface ionization detection. *J Chromatogr* 579(2): 247–252.

Seno H *et al.* (1999). High performance liquid chromatography/electrospray tandem mass spectrometry for phenothiazines with heavy side chains in whole blood. *Rapid Commun Mass Spectrom* 13: 2394–2398.

Thioacetazone

Antibacterial, Tuberculostatic

$C_{10}H_{12}N_4OS = 236.3$

CAS—104-06-3

IUPAC Name *N*-[4-[(Carbamothioylhydrazinylidene)methyl]phenyl]acetamide

Synonyms *N*-[4-[(Aminothioxomethyl)hydrazono]methyl]phenyl]acetamide; amithiozone; Tbl-698; tebezonom; thiacetazone.

Proprietary Names *Conteben; Livazore; Neustab; Panrone; Seroden.*

Chemical Properties Pale yellow crystals or crystalline powder. Mp 225° to 230°, with decomposition. Insoluble in water, acetone, benzene and chloroform; soluble 1 in 500 of ethanol and 1 in 100 of propylene glycol; practically insoluble in ether. Log *P* (octanol/water), 1.1.

Colour Tests Nessler's reagent (100°)—black; palladium chloride—orange.

Thin-layer Chromatography System TA— R_f 0.78 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2038.

Ultraviolet Spectrum Ethanol—328 nm ($A_1^1=1870a$).

Infrared Spectrum Principal peaks at wavenumbers 1515, 1603, 1580, 1661, 1250, 1305 cm^{-1} (KBr disk).

Quantification

Plasma HPLC UV detection. Limit of detection, 3 µg/L [Jenner 1983; Jenner *et al.* 1984].

Urine HPLC See Plasma [Jenner 1983; Jenner *et al.* 1984].

Disposition in the Body Thioacetazone is slowly absorbed after oral administration. Most of a dose is metabolised and excreted in the urine; about 20% of a dose is excreted in the urine unchanged.

Therapeutic Concentration

Following a single oral dose of 4 mg/kg to 10 subjects, peak serum concentrations of 1.3 to 4.0 (mean, 3.1) mg/L were attained in about 5 h [Sen *et al.* 1973].

Half-life About 8 to 12 h.

Dose Up to 150 mg daily.

Jenner PJ (1983). High-performance liquid chromatographic determination of thiacetazone in body fluids. *J Chromatogr* 276: 463–470.

Jenner PJ *et al.* (1984). A study of thiacetazone blood levels and urinary excretion in man, using high performance liquid chromatography. *Lepr Rev* 55: 121–128.

Sen PK *et al.* (1973). Thiacetazone and INH in tuberculosis. Synchronised peak concentration drug administration for greater action. *J Indian Med Assoc* 61: 306–308.

Thiopental

Barbiturate

$C_{11}H_{18}N_2O_2S = 242.3$

CAS—76-75-5

IUPAC Name 5-Ethyl-5-pentan-2-yl-2-sulfanylidene-1,3-diazinane-4,6-dione

Synonyms 5-Ethylidihydro-5-(1-methylbutyl)-2-thio-4,6(1*H*,3*H*,5*H*)-pyrimidin-2-one; penthiobarbital; thiomebumal; thiopentone.

Chemical Properties pK_a 7.6 (20°). Log *P* (octanol/water), 2.85. Extraction yield, 0.9 [Demme *et al.* 2005].

Thiopental Sodium

$C_{11}H_{17}N_2NaO_2S = 264.3$

CAS—71-73-8

Synonyms Penthiobarbital sodique; soluble thiopentone; thiomebumalnatricum cum natrii carbonate; thiopental sodium and sodium carbonate; thiopentalum natricum; thiopentobarbitalum solubile; thiopentone sodium.

Proprietary Names *Farmotal; Intraval Sodium; Nesdonal; Pentothal; Trapanal.*

Chemical Properties A white to yellowish-white to pale green, hygroscopic powder. It usually contains anhydrous sodium carbonate in the proportion of 6 parts to each 100 parts of thiopental sodium. Soluble 1 in 1.5 of water; partly soluble in ethanol; insoluble in ether, benzene and petroleum ether.

Colour Tests Koppanyi–Zwicker test—violet; palladium chloride—orange; vanillin reagent—brown-red/violet.

Thin-layer Chromatography System TD— R_f 0.77; system TE— R_f 0.49; system TF— R_f 0.74; system TH— R_f 0.80; system TAD— R_f 0.68. Thiopental sodium: system TAJ— R_f 0.73; system TAK— R_f 0.71; system TAL— R_f 0.92 (mercuric chloride–diphenylcarbazone reagent, positive; mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown; Zwicker's reagent, green).

Gas Chromatography System GA—thiopental RI 1857, thiopental- Me_2 RI 1825, pentobarbital RI 1735; system GB—thiopental RI 1923, M (OH-) RI 2134; system GF—RI 2600; system GAJ—RRT 0.948 (relative to methylphenobarbital).

High Performance Liquid Chromatography System HX—RI 485; system HY—RI 433; system HZ—retention time 6.9 min; system HAA—retention time 19.2 min.

Column: ODS C_{18} (150 × 4.6 mm i.d., 4 µm). Mobile phase: water : methanol : acetonitrile (50 : 40 : 10), adjusted to pH 2.70 with phosphoric acid, flow rate 1.5 mL/min. UV detection ($\lambda = 290$ nm). IS: tolylbarb. Retention time: thiopental, 9.5 min; thiopental isomer, 8.4 min; IS, 5.4 min [Coppa *et al.* 2001].

Column: C_8 Whatman PatriSphere (110 × 4.6 mm i.d.). Mobile phase: 50% acetonitrile : phosphate buffer (120 mmol/L, pH 6.2). UV detection (270 nm). Retention time 4.3 min [Schmid, Wolf 1989].

Column: Chiral AGP (100 × 4.0 mm i.d.); guard, (10 × 3.0 mm i.d.). Mobile phase: 20 mmol/L phosphate buffer : 2-propanol : methanol (93.5 : 5.0 : 1.5), pH 5.0, flow rate 0.9 mL/min. UV detection. Retention time: (R)-(+)–thiopental, 2.7 (4.8 min); (S)-(–)–thiopental, 3.7 (6.2 min) [Jones *et al.* 1996].

Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—255, 304 nm ($A_1^1=1138b$); 1 mol/L sodium hydroxide (pH 13)—303 nm ($A_1^1=1170b$).

Infrared Spectrum Principal peaks at wavenumbers 1670, 1540, 1300, 1170, 1735, 1220 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 172, 157, 173, 43, 41, 55, 69, 71.

Quantification

Blood HPLC UV detection ($\lambda = 270$ nm). Limit of detection, 0.2 mg/L [Schmid, Wolf 1989]. UV detection. Limit of detection, 1 mg/L [Levine *et al.* 1983].

Plasma GC AFID. Limit of detection, 0.025 mg/L [Jung *et al.* 1981].

HPLC UV detection ($\lambda = 280$ nm). Limit of quantification, 0.01 mg/L [Jones *et al.* 1996]. UV detection. Limit of detection, 0.2 mg/L [Salvadori *et al.* 1981].

Serum HPLC UV detection ($\lambda = 280$ nm). Limit of detection, 0.1 mg/L [Altmayer *et al.* 1987].

Tissues HPLC See Blood [Levine *et al.* 1983].

See also under Amobarbital.

Disposition in the Body About 10% of a dose is concentrated in the brain within 1 min of an IV injection and it is then rapidly distributed throughout the body, eventually accumulating in body fat; about 50% of a dose accumulates in this way after 30 to 90 min. The very short action of thiopental is due to the brief α -phase half-life and the redistribution of the drug from the brain to other fatty tissues. Metabolic reactions include ω -hydroxylation, further oxidation and, to a lesser extent, desulfuration to pentobarbital. Metabolism occurs almost exclusively in the liver and mostly inactive metabolites are produced. Less than 1% of a dose is excreted in the urine as unchanged drug. 5-(3-Carboxy-1-methylpropyl)-5-ethyl-2-thiobarbituric acid has been reported to be a urinary metabolite. Repeated or continuous administration of thiopental may result in accumulation of the drug in fatty tissues which may result in extended anaesthesia and possibly respiratory and/or cardiovascular depression. Thiopental readily diffuses across the placenta and has been detected in breast milk.

Therapeutic Concentration

Plasma concentrations of 4.2 to 134 mg/L (mean, 28) were reported in 22 patients after IV injections [Becker 1976].

After multiple IV doses of 250 (5 subjects) or 500 mg (2 subjects) every 2 h for up to 7 days to neurosurgical patients, the steady-state trough plasma concentrations were 4.8 to 30 mg/L (mean, 16.0) and the peak concentrations were 8.35 to 45 mg/L (mean, 25.4) [Russo *et al.* 1995].

Toxicity The estimated minimum lethal dose is 1 g. Numerous fatalities have occurred owing to accidental or intentional overdose, and blood concentrations from 6 to 392 mg/L have been reported in fatalities.

The following postmortem tissue distribution was reported in one suicide case: blood 6 mg/L, brain 24 μ g/g, heart 22 μ g/g, kidney 31 μ g/g, and liver 63 μ g/g [Bruce *et al.* 1977].

In a fatality caused by IV self-administration of thiopental, the following postmortem tissue concentrations were reported: blood 285 mg/L, brain 414 μ g/g, kidney 195 μ g/g, liver 440 μ g/g [Reed, Monforte 1973].

The blood concentration of an individual who died following IV administration of a clinical dose was 0.6 mg/L. The brain concentration was 11.9 mg/kg and thiopental was also detected in the thymus at a concentration of 7.66 μ g/g [Yasuda *et al.* 1993].

Half-life Plasma half-life, 4 to 20 h (mean, 9), increased after high doses (25 mg/min), up to 60 h.

Volume of Distribution 0.5 to 4 L/kg.

Clearance Plasma clearance, 1 to 4 mL/min/kg.

Distribution in Blood Plasma: whole blood ratio, 1.0.

Protein Binding About 75 to 90%.

Dose Premedicated adults, 100 to 150 mg of thiopental sodium IV over 10 to 15 s (25 g/L solution), repeated if necessary, or up to 4 mg/kg. Children, 2 to 7 mg/kg.

Thiopropazate

Tranquilliser

$C_{23}H_{28}ClN_3O_2S = 446.0$

CAS—84-06-0

IUPAC Name 2-[4-[3-(2-Chlorophenothiazin-10-yl)propyl]piperazin-1-yl]ethyl acetate

Synonym 4-[3-(2-Chlorophenothiazin-10-yl)propyl]-1-piperazineethanol acetate

Chemical Properties Practically insoluble in water; soluble in chloroform and ether. pK_a 7.3 (24°). Log *P* (octanol/water), 4.8.

Thiopropazate Hydrochloride

$C_{23}H_{28}ClN_3O_2S \cdot 2HCl = 518.9$

CAS—146-28-1

Proprietary Names *Dartal*; *Dartalan*.

Chemical Properties A white or pale yellow crystalline powder. Mp 223° to 229°, with decomposition. Soluble 1 in 4 of water, 1 in 130 of ethanol and 1 in 65 of chloroform; practically insoluble in ether.

Caution Thiopropazate hydrochloride may cause severe dermatitis in sensitised persons.

Colour Tests Formaldehyde-sulfuric acid—red-violet; Forrester reagent—red; FPN reagent—red; Liebermann's reagent—green-brown; Mandelin's test—violet; Marquis test—violet.

Thin-layer Chromatography System TA— R_f 0.61; system TB— R_f 35; system TC— R_f 0.53; system TE—thiopropazate R_f 0.74, M R_f 0.46; system TL— R_f 0.42; system TAE—thiopropazate R_f 0.62, M R_f 0.48; system TAF— R_f 0.59; system TAJ— R_f 0.52; system TAK— R_f 0.36; system TAL— R_f 0.91. (Dragendorff spray, positive; FPN reagent, pink; acidified iodoplatinate solution, positive; Marquis reagent, red; Ninhydrin spray, positive).

Gas Chromatography System GA—RI 3467 (metabolised to perphenazine, see monograph for data).

High Performance Liquid Chromatography System HA— k 1.0; system HX—RI 483.

Ultraviolet Spectrum Aqueous acid—255 ($A_1^1=733a$), 305 nm; aqueous alkali—257 nm.

Infrared Spectrum Principal peaks at wavenumbers 1222, 1728, 746, 1265, 1250, 1200 cm^{-1} (thiopropazate hydrochloride, KBr disk).

Mass Spectrum Principal ions at m/z 42, 43, 70, 246, 185, 55, 56, 445.

Dose Initially 15 to 30 mg of thiopropazate hydrochloride daily; maximum of 100 mg daily.

Thiopropazine

Tranquilliser

$\text{C}_{22}\text{H}_{30}\text{N}_4\text{O}_2\text{S}_2 = 446.6$

CAS—316-81-4

IUPAC Name *N,N*-Dimethyl-10-[3-(4-methylpiperazin-1-yl)propyl]phenothiazine-2-sulfonamide

Synonyms RP-7843; SKF-5883.

Chemical Properties Crystals. Mp 140°. Practically insoluble in water. Log *P* (octanol/water), 2.9.

Thiopropazine Mesilate

$\text{C}_{22}\text{H}_{30}\text{N}_4\text{O}_2\text{S}_2 \cdot 2\text{CH}_4\text{O}_3\text{S} = 638.8$

CAS—2347-80-0

Synonyms Thiopropazine dimethanesulfonate; thiopropazine mesylate; thiopropazine methanesulfonate.

Proprietary Name *Majeptil*; *Vontil*

Chemical Properties A fine, white or pale cream powder, which becomes coloured on exposure to light. Mp about 227°. Soluble in water; slightly soluble in ethanol.

Colour Tests Formaldehyde-sulfuric acid—pink; Forrest reagent—red; FPN reagent—orange; Mandelin's test—brown→green→violet; Marquis test—red.

Thin-layer Chromatography System TA— R_f 0.46; system TB— R_f 0.07; system TC— R_f 0.34; system TE—thiopropazine R_f 0.43, M R_f 0.26; system TL— R_f 0.06; system TAE—thiopropazine R_f 0.22, M R_f 0.13; system TAF— R_f 0.22 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—thiopropazine RI 3552, M (ring) RI 3200.

High Performance Liquid Chromatography System HA— k 4.1; system HX—RI 427; system HY—RI 305; system HZ—retention time 15.4 min; system HAA—retention time 15.2 min.

Ultraviolet Spectrum Aqueous acid—234, 263 ($A_1=668a$), 312 nm. No alkaline shift.

Infrared Spectrum Principal peaks at wavenumbers 1156, 1042, 1212, 720, 960, 762 cm^{-1} (thiopropazine mesilate, Nujol mull).

Mass Spectrum Principal ions at m/z 79, 96, 31, 113, 81, 70, 127, 78.

Quantification

Blood GC SID. Limit of detection, 250–500 ng/L [Hattori *et al.* 1992].

Urine GC See Blood [Hattori *et al.* 1992].

Dose Usually 15 to 30 mg of thiopropazine mesilate daily; up to 90 mg daily has been given.

Hattori H *et al.* (1992). Sensitive determination of phenothiazines in body fluids by gas chromatography with surface ionization detection. *J Chromatogr* 579(2): 247–252.

Thioridazine

Tranquilliser

$\text{C}_{21}\text{H}_{26}\text{N}_2\text{S}_2 = 370.6$

CAS—50-52-2

IUPAC Name 10-[2-(1-Methylpiperidin-2-yl)ethyl]-2-methylsulfanylphenothiazine

Synonym 10-[2-(1-Methyl-2-piperidinyl)ethyl]-2-(methylthio)-10H-phenothiazine

Proprietary Names *Mellaril-S*; *Melleretten*; *Melleril*; *Rideril*.

Chemical Properties A white or slightly yellow crystalline powder that darkens on exposure to light. Mp 72° to 74°. Practically insoluble in water; soluble 1 in 6 of ethanol, 1 in 0.8 of chloroform and 1 in 3 of ether; freely soluble in dehydrated alcohol. pK_a 9.5 (24°). Log *P* (octanol/water), 5.90. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Serum samples were stable for up to 8 h at room temperature and up to 2 weeks when stored at 4° and -20° [Tanaka *et al.* 2007]. Stock standard solutions were stable for up to 2 months at 4° [Svendsen, Bird 1986].

Thioridazine Hydrochloride

C₂₁H₂₆N₂S₂·HCl = 407.0
CAS—130-61-0

Proprietary Names Aldazine; Mallorol; Mellaril; Melleretten (tablets); Melleril (tablets); Melzine; Novoridazine; Orsanil; Thioril; Thiozine.

Chemical Properties A white or slightly yellow crystalline powder. Mp 158° to 160° (crystals from acetone). Soluble 1 in 9 of water, 1 in 10 of ethanol and 1 in 1.5 of chloroform; freely soluble in methanol; practically insoluble in ether.

Colour Tests Formaldehyde-sulfuric acid—blue; Forrest reagent—blue; FPN reagent—blue; Mandelin's test—blue→violet; Marquis test—violet-red→blue-green.

Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.42; system TC—R_f 0.30; system TE—R_f 0.67; system TL—R_f 0.13; system TAE—R_f 0.20; system TAF—R_f 0.55; system TAJ—R_f 0.09; system TAK—R_f 0.02; system TAL—R_f 0.51 (Dragendorff spray—positive; Marquis reagent—grey-violet).

Gas Chromatography System GA—thioridazine RI 3115, mesoridazine RI 3380, M (oxo-) RI 3500, M (ring sulfone) RI 3420, M (side chain sulfone) RI 3800; system GB—thioridazine RI 3292, M (nor-) RI 3275, mesoridazine RI 3629, M (ring) RI 2639, M (ring sulfone) RI 3626; system GW—RT 31.1 min.

High Performance Liquid Chromatography System HA—thioridazine *k* 5.2, mesoridazine RI 5.0; system HX—RI 490; system HY—RI 427; system HZ—RT 13.5 min; system HAA—RT 17.2 min; system HAM—not detected; system HAX—not eluted; system HAY—RT 9.8 min; system HAZ—*k* 3.88.

Ultraviolet Spectrum Aqueous acid—262 nm (A₁¹ = 987a), 310 nm; (0.1 mol/L hydrochloric acid)—230, 263 nm; aqueous alkali—275 nm; (0.1 mol/L sodium hydroxide)—313 nm.

Infrared Spectrum Principal peaks at wavenumbers 754, 1248, 796, 1234, 1281, 1211 cm⁻¹ (KBr disk).

Mass Spectrum Principal ions at *m/z* 98, 370, 126, 99, 40, 70, 371, 258 (thioridazine); 98, 70, 99, 42, 386, 126, 55, 41 (mesoridazine).

Quantification

Blood GC Column: cross-linked fused silica (25 m × 0.2 mm i.d., 0.11 μm). Carrier gas: He, 195 kPa. Temperature programme: 180° for 1 min to 300° at 10°/min for 3 min. NPD. Retention time: 12.8 min. Limit of quantification, 122–218 μg/L, limit of detection, 37–66 μg/L [Sánchez de la Torre *et al.* 2005].

HPLC UV detection (λ = 263 nm). Limit of quantification, 0.05 mg/L [Jortani *et al.* 1994]. Column: Bondapak CN (300 × 4 mm i.d., 10 μm). Mobile phase: methanol:0.01% *n*-octylamine (58:42), flow rate 2.0 mL/min. UV detection (λ = 265 nm). Retention time: 12.5 min. Limit of detection, 4 mg/L [Allender 1985]. Column: Spherosil XOC-005 (250 × 2.8 mm i.d., 9 μm). Mobile phase: 2,2,4-trimethylpentane:2-aminopropane:acetonitrile:ethanol. Fluorescence detection (λ_{ex} = 365 nm, λ_{em} = 440 nm). Limit of detection, 3 ng [Muusze, Huber 1974].

Plasma GC Column: CBP1-bonded methyl silicone (12 m × 0.53 mm i.d., 1 μm). Carrier gas: He, 20 mL/min. Temperature programme: 200° for 2 min to 300° at 10°/min. NPD. Limit of detection, 200 μg/L [Tokunaga *et al.* 1996]. Column: 3% OV-17 Gaschrom Q on 80/120 mesh (1 m × 2 mm i.d.). Carrier gas: N₂, 40 mL/min. Temperature: 264°. FID. Retention time: 3.1 min. Limit of detection, 2 ng [Ng, Grammer 1977]. Column: 3% OV-17 on Chromosorb Q 100/120 mesh (1.8 m × 2 mm i.d.). Carrier gas: He, 100 mL/min. Temperature: 275°. FID. Retention time: 3.6 min. Limit of detection, 0.05 mg/L [Dinovo *et al.* 1976]. Column: 3% XE-60 on GasChrom Q 80/100 mesh (1.83 m × 4 mm i.d.). Carrier gas: N₂, 30 mL/min. Temperature programme: 240° for 15 min to 270° at 10°/min for 30 min. FID. Retention time: 2.47 min. Limit of detection, 100 μg/L [Vanderheeren, Theunis 1976]. Column: 3% OV-17 on GasChromQ 100/120 mesh. Carrier gas: N₂, 60 mL/min. Temperature: 260°. FID. Limit of detection, 0.05 mg/L [Curry, Mould 1969].

HPLC Column: Cyclobond I2000 (250 × 4.6 mm i.d.). Mobile phase: acetonitrile:1% TEA (pH 3.0, 16:84), flow rate 1.2 mL/min. Fluorescence detection (λ_{ex} = 262 nm, λ_{em} = 458 nm). Limit of quantification, 15 μg/L for thioridazine, 5 μg/L for the metabolites [Eap *et al.* 1995]. Column: IBM cyano. Mobile phase: acetonitrile:50 mmol/L ammonium acetate (pH 6, 70:30), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Limit of detection, 1 μg/L [Cohen *et al.* 1989]. Column: Cyano-bonded (300 × 3.9 mm i.d.). Mobile phase: 20 mmol/L disodium EDTA:THF (70:30), flow rate 1.5 mL/min. Electrochemical detection. Limit of detection, 0.1 ng/injection [Stoll *et al.* 1984]. Column: Spherisorb ODS C₁₈-bonded (250 × 4.6 mm i.d., 5 μm). Mobile phase: 2,2,4-trimethylpentane:methylene chloride:methanol (8:1:1) containing 0.036% methylamine, flow rate 2.25 mL/min. UV detection (λ = 254 nm). Limit of detection, 10 μg/L [Kilts *et al.* 1982].

Serum GC Column: SE-30 (11.5 m × 0.39 mm i.d., 0.4 μm). Carrier gas: N₂, 50 cm/s. Temperature: 260°. NSD. Retention time: 4 min 36 s. Limit of detection, 6 ng [Debruyne *et al.* 1980]. Column: 3% OV 17 on GasChrom Q (1 m × 3 mm i.d.). Carrier gas: N₂, 50 mL/min. Temperature: 260°. FID. Limit of detection, 50 mg/L [Mårtensson, Roos 1973].

HPLC Column: Inersil ODS-SP C₁₈ (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile:methanol:30 mmol/L sodium dihydrogen phosphate (pH 5.6, 300:200:500), flow rate 0.9 mL/min. UV detection (λ = 250 nm). Retention time: 31.7 min. Limit of quantification, 4.0 μg/L [Tanaka *et al.* 2007]. Column: Spherisorb Chiral I (250 × 4.6 mm i.d.). Mobile phase: hexane:methylene chloride:methanol:1 mol/L ammonium acetate in methanol (450:450:100:0.075), flow rate 1.0 mL/min. UV detection (λ = 263 nm). Limit of quantification, 50 μg/L, limit of detection, 12.5 μg/L [Jortani, Poklis 1993]. Column: Spherisorb ODS-2 Superpac (250 × 4 mm i.d., 5 μm). Mobile phase: acetonitrile:methanol:85% orthophosphoric acid suprapur-TEA (1:2:1), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Retention time: 10.95 min. Limit of detection, 0.5 μmol/L [Svensson *et al.* 1990]. Column: (15 cm, 5 μm). Mobile phase: *n*-butyl chloride-propan-2-ol-water-diethylamine (92:7.9:0.08:0.02):*n*-butyl chloride-propan-2-ol-water-diethylamine (91.8:7.9:0.08:2.0) (50:50), flow rate 1.7 mL/min to 2.0 mL/min over 5 min. UV detection, (λ = 279 nm). Retention time: 2.1 min. Limit of detection not reported [Hale, Poklis 1985].

LC-MS Column: Chromolith Speed ROD C₁₈ (50 × 4.6 mm i.d., 5 μm). Mobile phase: methanol:5 mmol/L acetic acid (pH 3.9) in ammonia (20:80 to 70:30 at 4 min for 1 min to 20:80), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 2.7 μg/L [Kirchherr, Kühn-Velten 2006]. Column: Uptisphere (125 × 2 mm i.d., 5 μm). Mobile phase: 50 mmol/L ammonium acetate (pH 4.0)-acetonitrile:acetonitrile (90:10), flow rate 300 μL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 54 nmol/L [Guttek, Rentsch 2003].

Urine GC Column: 3% OV-17 on GasChrom Q 80/120 mesh (1 m × 2 mm i.d.). Carrier gas: N₂, 40 mL/min. Temperature: 264° or 280°. FID. Retention time:

4.8 min. Limit of detection not reported [Papadopoulos, Crammer 1986]. See Plasma [Ng, Crammer 1977].

HPLC Column: LiChrosorb C₈ (150 × 4.6 mm i.d.). Mobile phase: acetonitrile: water:acetic acid: TEA (40:40:20:2), flow rate 0.5 mL/min. UV detection (λ=250 nm). Limit of quantification, 71.3 µg/L, limit of detection, 21.4 µg/L [Cruz-Vera *et al.* 2009]. Column: Symmetry C₈ (150 × 3.9 mm i.d., 5.0 µm). Mobile phase: 0.03 mol/L ammonium acetate (pH 5.5): acetonitrile (60:40), flow rate 1.0 mL/min. UV detection (λ=238 nm). Limit of quantification, 25 µg/L, limit of detection, 8 µg/L [Xiong *et al.* 2009]. Column: Spherisorb cyano (150 × 4.6 mm i.d., 3 µm). Mobile phase: 2,2,4-trimethylpentane: dichloromethane: methanol: diethylamine (82:10:8:0.1), flow rate 1.1 mL/min. UV detection (λ=254 nm). Retention time: 2.9 min. Limit of detection, 50 µg/L [Lin *et al.* 1993]. See Blood [Allender 1985].

Bile HPLC See Blood [Allender 1985; Jortani *et al.* 1994].

CSF GC Column: 0.85% OV-225 on GasChrom Q 80/100 mesh (1 m × 2 mm i.d.). Temperature: 260°. NSD. Limit of detection not reported [Nyberg *et al.* 1981].

Gastric Contents HPLC See Blood [Allender 1985].

Brain HPLC See Blood [Jortani *et al.* 1994]. Column: µBondapak (300 × 3.9 mm i.d.). Mobile phase: 100 mmol/L ammonium acetate, 20 mmol/L citric acid and 100 µL butylamine in acetonitrile: water (38:62, pH 3.4), flow rate 1.5 mL/min. Electrochemical detection. Retention time: 26.7 min. Limit of detection, 50 pg/mg [Svendsen, Bird 1986].

Hair GC-MS Column: BP-5 (12 m × 0.53 mm i.d., 1.0 µm). Carrier gas: He, 3.0 mL/min. Temperature programme: 100° for 2 min to 310° at 10°/min for 10 min. NPD. Limit of detection, 0.1–0.25 µg/g [Couper *et al.* 1995].

LC-MS Column: RP-C8-select B (125 × 2 mm i.d., 5 µm). Mobile phase: 1 mmol/L ammonium formate-0.1% formic acid (pH 3): acetonitrile-0.1% formic acid (90:10 to 70:30 at 6.6 min to 30:70 at 26.6 min to 10:90 at 33.3 min. MRM acquisition mode. Limit of quantification, 0.042 ng/mg, limit of detection, 0.014 ng/mg [Weinmann *et al.* 2002].

Liver HPLC See Blood [Allender 1985; Jortani *et al.* 1994].

Disposition in the Body Readily absorbed after oral administration. It is metabolised mainly by sulfoxidation to give the side-chain sulfoxide (mesoridazine) and the side-chain sulfone (sulfuridazine), both of which are active, and the ring sulfoxide and sulfone; *N*-demethylation also occurs. Other metabolites are produced by combinations of these metabolic reactions [Lin *et al.* 1993]. It is metabolised in the liver, secreted in the bile and excreted mainly in the faeces. Less than ~10% of a dose is excreted in the urine, with <1% as unchanged drug; mesoridazine and sulfuridazine are also excreted in the urine in amounts slightly greater than unchanged drug.

Therapeutic Concentration Plasma concentrations of drug and metabolites show considerable intersubject variation [Mårtensson, Roos 1973]. Concentrations appear to be independent of dose and tend to decrease during chronic treatment. The therapeutic serum concentration is 0.2–1.0 mg/L (thioridazine); 0.3 mg/L (mesoridazine).

After a single oral dose of 100 mg administered in 5 subjects, the following peak serum concentrations were found: thioridazine 0.05–0.50 mg/L (mean 0.24), attained in 1–4 h; mesoridazine 0.10–0.51 mg/L (mean 0.32), attained in 2–6 h; sulfuridazine 0.02–0.11 mg/L (mean 0.07), attained in 5–8 h; ring sulfoxide 0.07–0.38 mg/L (mean 0.18), attained in 4–8 h [Axelsson, Martensson 1977].

Following daily oral doses of 100–800 mg (mean 382) to 17 subjects, serum concentrations, determined 12 h after a dose, were thioridazine 0.4–2.0 mg/L (mean 0.9), mesoridazine 0.2–1.6 mg/L (mean 0.8), sulfuridazine 0–0.6 mg/L (mean 0.2) and ring sulfoxide 0.06–4.0 mg/L (mean 1.5) [Axelsson *et al.* 1982].

Eight patients between 20 and 40 years of age and 8 patients over 65 years were administered a single oral dose of 25 mg thioridazine. At 4 h post-dosing, the young and elderly patient groups had concentrations of 47.6 and 106 µg/L, respectively, and at 8 h the concentrations were 33.2 and 66.6 µg/L, respectively [Cohen, Sommer 1988].

The following pharmacokinetic parameters of thioridazine, mesoridazine and sulfuridazine were measured after the administration of 25, 50 or 100 mg thioridazine to 11 healthy volunteers:

Toxicity The estimated minimum lethal dose is 1 g. Blood concentrations greater than ~2 mg/L may produce toxic effects and can be lethal; and with sulfuridazine, a total concentration of 3 mg/L drug and metabolite is toxic.

Dose (mg)	C _{max} (µg/L)	t _{max} (h)
Thioridazine		
25	110.8	1.77
50	197.1	1.36
100	371.8	1.48
Mesoridazine		
25	168.5	2.63
50	334.0	3.32
100	514.1	3.17
Sulfuridazine		
25	31.7	4.65
50	53.3	4.91
100	89.9	6.43

[Chakraborty *et al.* 1989]

A 68-year-old man with known severe depressive illness self-administered a high dose of thioridazine; ~80 tablets (each 200 mg slow release). He was admitted to hospital 4 h after ingestion and gastric lavage was able to remove 25 tablets. On arrival at hospital, he was drowsy and progressively lost consciousness over the next 6 h, resulting in coma and failing respiration. Over a period of 9 days, the central nervous, cardiovascular and gastrointestinal systems showed thioridazine toxicity. At high toxic levels of the drug, 6.06–6.48 mg/L, life-threatening malignant ventricular arrhythmias occurred as well as bradycardia. The thioridazine concentration was 3.34 mg/L when the patient slipped into a coma. The patient recovered following the appropriate treatment; 10 days after ingestion, he was transferred from the intensive care unit [Schmidt, Lang 1997].

In 8 deaths involving the ingestion of thioridazine, the following thioridazine and metabolite concentrations (range in parentheses) were found as shown in table below.

In 2 deaths attributed to thioridazine overdose, the following postmortem concentrations were reported:

	Blood (mg/L)	Liver (µg/g)*
Thioridazine	8.85, 2.43	138, 50
Mesoridazine	26.8, 0.29	–
Sulfuridazine	0.87, 0	–

*Total thioridazine plus metabolites determined by a non-specific fluorimetric assay. The determination of 2 stereoisomeric ring sulfoxides is also discussed [Poklis *et al.* 1982].

Note For a study of a possible relationship between thioridazine cardiotoxicity and CYP2D6 hydroxylation capacity, see Llerena *et al.* [2002]. For a study of the postmortem distribution of thioridazine, see Dinovo *et al.* [1978]; for uptake into the human retina, see Kimbrough, Campbell [1981].

Half-life Plasma half-life, 10–36 h.

Distribution in Blood Plasma: whole blood ratio, 0.79.

Protein Binding Thioridazine >99.5%; mesoridazine and sulfuridazine, ~99%.

Dose Daily dosage 50 to 300 mg thioridazine hydrochloride; maximum 600 mg daily.

Chemical Properties Fine white crystalline flakes. Mp 51.5°. Soluble 1 in 13 of water, 1 in about 8 of ethanol, 1 in 2 of chloroform and 1 in about 4 of ether. Log P (octanol/water), 0.5.

Caution Thiotepe is irritant; avoid contact with skin and mucous membranes.

Thin-layer Chromatography System TAE—R_f 0.75.

Gas Chromatography System GA—RI 1504.

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Infrared Spectrum Principal peaks at wavenumbers 932, 1255, 729, 718, 669, 815 cm⁻¹ (solution in carbon disulfide).

Quantification

Plasma GC Selective NPD. Thiotepe and metabolites [van Maanen *et al.* 2000].

Thonzylamine

Antihistamine

C₁₆H₂₂N₄O = 286.4

CAS—91-85-0

IUPAC Name N'-[(4-Methoxyphenyl)methyl]-N,N-dimethyl-N'-pyrimidin-2-ylethane-1,2-diamine

Synonym Histylamine

Chemical Properties An oily liquid. Practically insoluble in water; soluble in chloroform. pK_a 2.1, 8.8 (25°).

Thonzylamine Hydrochloride

C₁₆H₂₂N₄O·HCl = 322.8

CAS—63-56-9

Proprietary Name Tonamil

Chemical Properties A white crystalline powder. Mp 173° to 176°. Soluble 1 in 1 of water, 1 in 6 of ethanol and 1 in 4 of chloroform; practically insoluble in ether.

Colour Test Mandelin's test—red-violet.

Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.38; system TC—R_f 0.28; system TE—R_f 0.65; system TL—R_f 0.14; system TAE—R_f 0.22; system TAF—R_f 0.31 (Dragendorff spray, positive; Acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2203; system GC—RI 2576.

High Performance Liquid Chromatography System HA—k 3.2.

Ultraviolet Spectrum Aqueous acid—236 (A₁=857a), 274, 316 nm.

Infrared Spectrum Principal peaks at wavenumbers 1515, 1593, 1550, 1250, 1613, 1175 cm⁻¹ (KBr disk).

Thiotepe

Antineoplastic

C₆H₁₂N₃PS = 189.2

CAS—52-24-4

IUPAC Name Tris(aziridin-1-yl)sulfanylidene-λ⁵-phosphane

Synonyms 1,1',1''-Phosphinthioylidynetrisaziridine; TESPA; thiophosphamide; triethylenethiophosphoramidate; TSPA.

Proprietary Names Ledertepa; Tespamin; Thioplex; Tifosyl.

T

Mass Spectrum Principal ions at m/z 58, 121, 72, 71, 216, 215, 122, 78.

Dose Usually 50 to 100 mg of thonzylamine hydrochloride daily.

Thozalinone

Antidepressant

$C_{11}H_{12}N_2O_2 = 204.2$

IUPAC Name 2-(Dimethylamino)-5-phenyl-1,3-oxazol-4-one

Synonyms CL-39808; 2-dimethylamino-4-oxo-5-phenyl-2-oxazoline; tozalinon(e).

Proprietary Name *Stimsen*

Chemical Properties White crystalline powder. Mp 133° to 136°. Soluble in dilute acetic acid. Thozalinone is extracted by chloroform from aqueous alkaline solutions.

Colour Test Ammonium molybdate test—pale blue, developing slowly (limit of detection, 1.0 μg).

Thin-layer Chromatography System T1— R_f 0.59 (location reagent potassium permanganate spray, positive reaction).

Ultraviolet Spectrum 0.1 N sulfuric acid—226 (E1%, 1 cm 1240), 262 (E1%, 1 cm 20) and 268 nm (E1%, 1 cm 13).

Infrared Spectrum Principal peaks at wavenumbers 1623, 1391 or 1412, 1274 cm^{-1} (KBr disk).

Disposition in the Body

Toxicity LD_{50} in mice 2 g/kg (oral).

Thurfyl Nicotinate

Peripheral Vasodilator, Rubefacient

$C_{11}H_{13}NO_3 = 207.2$

CAS—70-19-9

IUPAC Name Oxolan-2-ylmethyl pyridine-3-carboxylate

Synonyms Nicotafuryl; nicotinic acid tetrahydrofurfuryl ester; tetrahydrofurfuryl nicotinate; tetrahydrofurfuryl pyridine-3-carboxylate.

Proprietary Name *Trafuril*

Chemical Properties Colourless liquid. Bp 114° to 116°. Soluble in water, oil and chloroform. Log *P* (octanol/water) 1.16 [Meylan, Howard 1995], 1.1 [National Institutes of Health 2008].

Thin-layer Chromatography System T1— R_f 0.62 (location reagent acidified iodoplatinate spray, positive reaction).

Quantification

Note For a photoelectric reflectometry and plethysmography investigation of thurfyl nicotinate in atopic dermatitis, see Thyne and Rajka [1974].

Disposition in the Body

Therapeutic Concentration

Thurfyl nicotinate has been used as a rubefacient in people with inflammatory joint diseases and in the management of mild disorders of the blood circulation of the hands and feet. Atopic individuals do not react with the erythema or urticaria of 'nonatopics'. The FDA has not approved its topical use [Fisher 1993; Fisher 1995].

Dose It is used as a topical application in creams and ointments.

Fisher AA (1993). Four flushers: topical agents producing facial flushing simulating the systemic variety. *Cutis* 51: 225–227.

Fisher AA (1995). Contactants that produce nonimmunologic erythema or urticaria: part I. *Cutis* 55: 132.

Thymol

Antiseptic

$C_{10}H_{14}O = 150.2$

CAS—89-83-8

IUPAC Name 5-Methyl-2-propan-2-ylphenol

Synonyms Acido timico; isopropylmetacresol; 5-methyl-2-(1-methylethyl)phenol; timol.

Proprietary Names *Flavinol; Intrasol; Medophyll*.

Chemical Properties Colourless crystals or white crystalline powder. Mp 51.5°. Soluble 1 in 1000 of water, 1 in 1 of ethanol, 1 in 0.6 of chloroform, 1 in 1.5 of ether and 1 in 1.7 of olive oil. pK_a 10.6 (20°). Log *P* (octanol/water), 3.3.

Colour Test Liebermann's reagent—black.

Thin-layer Chromatography System TD— R_f 0.73; system TE— R_f 0.81; system TF— R_f 0.68; system TAD— R_f 0.65; system TAF— R_f 0.92.

Gas Chromatography System GA—RI 1260.

High Performance Liquid Chromatography System HY—RI 544.

Ultraviolet Spectrum Aqueous acid—272 nm ($A_1^1=137b$); aqueous alkali—292 nm ($A_1^1=257b$).

Infrared Spectrum Principal peaks at wavenumbers 817, 1248, 1290, 1095, 1160, 952 cm^{-1} .

Mass Spectrum Principal ions at m/z 135, 150, 91, 107, 117.

Quantification

Tiabendazole

Anthelmintic

$C_{10}H_7N_3S = 201.3$

CAS—148-79-8

IUPAC Name 4-(1H-Benzimidazol-2-yl)-1,3-thiazole

Synonym TBZ; thiabendazole; 2-(4-thiazolyl)-1H-benzimidazole.

Proprietary Names *Eprofil; Equizole* (vet.); *Foldan; Foldem; Mintezol; Storite; Tecto; Thiaben; Thiprazole* (vet.); *Tiabiase; Triasox; Tutiverm*.

Chemical Properties A white or cream-coloured powder. Mp 300° to 305°. Practically insoluble in water; soluble 1 in 150 of ethanol, 1 in 300 of chloroform and 1 in 2000 of ether; soluble in dilute mineral acids. pK_a 4.6 (25°). Log *P* (octanol/water), 2.5.

Thin-layer Chromatography System TA— R_f 0.67; system TB— R_f 0.07; system TC— R_f 0.54; system TL— R_f 0.53; system TAE— R_f 0.75; system TAJ— R_f 0.46; system TAK— R_f 0.02; system TAL— R_f 0.59 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2040; system GK—RRT 1.18 relative to caffeine.

High Performance Liquid Chromatography System HY—RI 234.

Ultraviolet Spectrum Aqueous acid—243, 302 nm ($A_1^1=1230a$).

Infrared Spectrum Principal peaks at wavenumbers 740, 1306, 902, 1095, 1279, 1231 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 201, 174, 63, 202, 64, 65, 175, 90.

Quantification

Serum HPLC Fluorescence detection. Tiabendazole and 5-hydroxytiabendazole. Limit of detection, 100 $\mu\text{g/L}$ and 400 $\mu\text{g/L}$, respectively [Watts *et al.* 1982].

Disposition in the Body Tiabendazole is readily absorbed after oral administration; peak plasma concentrations are attained in 1 to 2 h. It is metabolised to the 5-hydroxy derivative and excreted in the urine as conjugates. About 90% of a dose is excreted in the urine in 48 h and 5% is eliminated in the faeces. <1% of a dose is excreted in the urine unchanged.

Half-life Plasma half-life, about 1 h.

Dose Usually 25 mg/kg twice daily, to a maximum daily dose of 3 g.

Watts MT *et al.* (1982). Determination of tiabendazole and 5-hydroxytiabendazole in human serum by fluorescence-detected high-performance liquid chromatography. *J Chromatogr* 230: 79–86.

Tiagabine

Anticonvulsant, Antidiabetic

$\text{C}_{20}\text{H}_{25}\text{NO}_2\text{S}_2 = 375.6$

CAS—115103-54-3

IUPAC Name (3*R*)-1-[4,4-Bis(3-methylthiophen-2-yl)but-3-enyl]piperidine-3-carboxylic acid

Synonyms Abbot-70569; ABT-569; NNC-05-0328; NO-05-0328; TGB.

Proprietary Name Gabitril

Chemical Properties pK_a 3.3. Extraction yield (chlorobutane), 0.5 [Demme *et al.* 2005].

Tiagabine Hydrochloride

$\text{C}_{20}\text{H}_{25}\text{NO}_2\text{S}_2 \cdot \text{HCl} = 412.0$

CAS—145821-59-6

Proprietary Name Gabitril

Chemical Properties A white to off-white odourless crystalline powder. Mp 192°. It is sparingly soluble in water; practically insoluble in hexane and heptane; soluble in aqueous base. pK_a 9.4.

Gas Chromatography-Mass Spectrometry Column: cross-linked 5% phenyl methyl siloxane HP-5MS (30 m \times 0.25 mm i.d., 0.25 μm). Column temperature: 100° increased at 20°/min to 300°. Carrier gas: He. EI ionisation, SIM acquisition mode, m/z : 156 IS: monomethyl analogue of tiagabine. Retention time: tiagabine, 11.9 min; IS, 11.5 min [Chollet *et al.* 1999].

High Performance Liquid Chromatography Column: OD Chiracel (250 \times 4.6 mm i.d.). Mobile phase: ethanol:hexane:isopropanol:trifluoroacetic acid (6:80:14:0.5). UV detection ($\lambda=290$ nm). Retention time: (*S*-(+)-tiagabine), 10.1 min; (*R*-(−)-tiagabine) 14.2 min [Rustum, Estrad 1998].

Column: l-phenylglycine (250 \times 4.6 mm i.d., 5 μm). Mobile phase: ammonium acetate (0.1 mol/L, pH 3.7): acetonitrile (69:31), flow rate 1.5 mL/min. UV detection ($\lambda=230$ nm). Retention time: *S*-(+)-tiagabine, 13.0 min; *R*-(−)-tiagabine, 15.7 min [Rustum *et al.* 1998].

Ultraviolet Spectrum

Mass Spectrum Principal ions at m/z 156, 157, 113, 111, 358, 96, 97, 81 (Tiagabine -Me).

Quantification

Serum GC-MS Limit of quantification, 5 $\mu\text{g/L}$, limit of detection 0.4 $\mu\text{g/L}$ [Chollet *et al.* 1999].

Plasma HPLC Limit of quantification, 2 $\mu\text{g/L}$ [Gustavson, Chu 1992].

Disposition in the Body Tiagabine is readily and virtually completely absorbed after oral administration, within 1 h of administration. Food prolongs absorption, however this reduces the rate but not the extent. Absorption and elimination pharmacokinetics are linear within the therapeutic dosage range. The drug is widely distributed throughout the body. It is extensively metabolised in the liver and excreted as the metabolite in faeces (64%) or to a lesser extent in urine (25%). Only 2% is eliminated as the unchanged drug. Hepatic metabolism occurs via cytochrome P450 enzymes CYP3A subfamily and no active metabolites have been identified. Two metabolic pathways have been identified: thiophene ring

T

oxidation leading to the formation of 5-oxo-tiagabine and glucuronidation. There is no drug accumulation after multiple doses and no change in pharmacokinetics in patients with renal impairment.

Therapeutic Concentration

Twenty-five patients, aged 19–64 years (mean, 44 years) with varying degrees of renal function—group (1): healthy volunteers; (2): mild renal impairment (creatinine clearance, 40–80 mL/min); (3): moderate (20–39 mL/min); (4): severe (5–19 mL/min); (5): patients requiring haemodialysis, were involved in the study. Groups 1 to 4 were orally administered with 4 mg doses of tiagabine hydrochloride as a single dose on day 1, multiple doses every 12 h for days 2 to 4 and a single dose on day 5. Group 5 was administered with a single 4 mg dose 2 h after haemodialysis. The mean total tiagabine plasma concentrations, after single doses, were 68.64, 108.09, 82.18, 80.50 and 51.65 µg/L for the 5 groups observed at 0.60, 0.50, 0.60, 0.63 and 1.20 h, respectively. For the multiple doses, the peak concentrations were 89.64, 125.25, 104.51 and 80.50 µg/L for groups 1 to 4 at 0.80, 0.44, 0.55 and 0.75 h, respectively [Cato *et al.* 1998].

Four patients with mild hepatic impairment, 2 with moderate hepatic impairment and 6 normal, healthy subjects were administered twice daily with oral tiagabine hydrochloride for 5.5 days. The healthy individuals produced peak plasma concentrations of 117 µg/L, the patients with mild hepatic impairment, 172 µg/L and moderate hepatic impairment, 172 µg/L. Minimum concentrations were 13, 27 and 28 µg/L for the 3 groups, respectively [Lau *et al.* 1997].

Toxicity

Reports of overdose are few and all episodes have recovered within 24 h. There is a broad therapeutic index. Median lethal doses are at least 50-fold higher than the maximum recommended doses (56 mg/day) [Graves *et al.* 1998].

Bioavailability

90–95%. **Half-life** 7–9 h. May be reduced to 2–3 h by the concomitant administration of liver enzyme-inducing drugs.

Volume of Distribution

1–1.3 L/kg. **Clearance** Mean systemic plasma clearance is 109 mL/min.

Protein Binding About 96% mainly to serum albumin and α_1 acid glycoprotein over the concentration range 10–10 000 µg/L.

Note For a review of the pharmacokinetics of tiagabine, see Adkins and Noble [1998].

Dose The usual dose is 30 to 45 mg daily.

Tianeptine

Antidepressant

$C_{21}H_{25}ClN_2O_4S = 436.95$

CAS—66981-73-5

IUPAC Name 7-[(3-chloro-6-methyl-5,5-dioxo-11H-benzo[c][2,1]benzothiazepin-11-yl)amino]heptanoic acid

Synonym 7-(3-Chloro-6-methyl-6,11-dihydrodibenzo[c,f][1,2]thiazepin-11-ylamino)heptanoic acid S,S-dioxide

Proprietary Name *Stablon*.

Tianeptine Sodium

$C_{21}H_{25}ClN_2NaO_4S = 459.9$

Chemical Properties Mp 180°.

High Performance Liquid Chromatography System HAA—RT 14.9 min.

Column: microbore Hypersil ODS (100 × 2.1 mm i.d.). Mobile phase: 20 mmol/L phosphate buffer containing TEA at 500 µL/L: acetonitrile (85:15 to 60:40 at 10 min to 25:75 in 3.5 min to 20:80 in 2.5 min), flow rate 0.4 mL/min. IS: prazepam. UV detection ($\lambda = 230$ nm). Retention time: tianeptine, 9.0 min; IS, 13.7 min [Turcant *et al.* 1991].

Quantification

Blood HPLC Column: Nova-Pack, C_{18} (300 × 3.9 mm i.d., 4 µm). Mobile phase: methanol:THF: 10 mmol/L potassium dihydrogen phosphate (0.68 g/L, pH 2.6, 65:5:30), flow rate 0.8 mL/min. UV detection ($\lambda = 210$ nm). Retention time: 5.40 min. Limit of detection, <120 µg/L [Tracqui *et al.* 1995]. Column: Hypersil ODS (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile: water (45:55), flow rate 1.3 mL/min. UV detection ($\lambda = 220$ nm). Limit of detection, 10 µg/L [Nicot *et al.* 1986].

Plasma HPLC Column: Nucleosil, C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile: 1.5 g/L sodium heptane sulfonate buffer (pH 3, 40:60), flow rate 1.3 mL/min. IS: pentanoic acid. UV detection ($\lambda = 220$ nm). Retention time: tianeptine 9.5 min, IS 6.2 min. Limit of quantification, 5 µg/L for tianeptine and its metabolite pentanoic acid (MC_5) [Gaulier *et al.* 2000].

Urine HPLC See Blood [Nicot *et al.* 1986].

Disposition in the Body Tianeptine drug is completely absorbed, although food delays absorption. It is completely metabolised by the liver and is not subject to first-pass metabolism. Metabolism occurs mainly by extrarenal routes. β -Oxidation is the major metabolic pathway, and the principal metabolites in plasma and urine are propanoic acid (MC_3 , inactive metabolite) and pentanoic acid (MC_5 , active metabolite). Pharmacokinetics are linear to the dosage. Less than 3% of the dose is excreted unchanged in urine. MC_5 half-life is 7.2 h. It is eliminated partly unchanged by the kidney, and undergoes biotransformation. Plasma concentrations reach steady state in 1 month and are maintained at month 3.

Therapeutic Concentration

Twelve elderly patients, aged between 72 and 81 years, were administered a single oral dose of 12.5 mg tianeptine twice daily for 18 days. The maximum plasma concentration of tianeptine was 353 µg/L after 1.81 h and for its metabolite MC_5 , 81 µg/L after 2.96 h from the single dose [Demotes-Mainard *et al.* 1991].

Twelve healthy volunteers were administered a single oral dose of 12.5 mg tianeptine following either an overnight fast or a standard breakfast. Peak plasma concentrations reached 322 µg/L in the fasted individuals after 1.29 h and were lower, 241.5 µg/L at ~1.79 h, in those who had eaten a meal before taking their dose [Dresse *et al.* 1988].

Half-life 2.5 h; increased in patients with renal failure; prolonged in patients suffering from depression (6.3 h).

Bioavailability $\approx 99\%$; 85% in the elderly.

Volume of Distribution 0.5–0.8 L/kg; 0.41 L/kg in the elderly.

Clearance Total plasma clearance, 14.5 L/h; 40% lower in the elderly.

Protein Binding 95%.

Dose Oral administration: 12.5 mg three times daily, which may be reduced to a maximum of 25 mg daily in the elderly and patients with renal impairment.

Tiaprofenic Acid

Analgesic

$C_{14}H_{12}O_3S = 260.3$

CAS—33005-95-7

IUPAC Name 2-(5-Benzoylthiophen-2-yl)propanoic acid

Synonyms 5-Benzoyl- α -methyl-2-thiopheneacetic acid; FC-3001; RU-15060.

Proprietary Names *Anafen*; *Artiflam*; *Artroreuma*; *Fengam*; *Flamirex*; *Gasam*; *Lindotab*; *Suralgan*; *Surdolin*; *Surgam*; *Surgamic*; *Surgamyl*; *Tiaprofen*; *Tiaprorex*.

Chemical Properties A white microcrystalline powder. Mp 96°. Slightly soluble in water; soluble in ethanol, chloroform and ether. pK_a 3.0. Log *P* (octanol/water), 2.8.

Thin-layer Chromatography System TE— R_f 0.04; system TF— R_f 0.05; system TAE— R_f 0.86; system TAJ— R_f 0.30; system TAK— R_f 0.80; system TAL— R_f 0.98.

Gas Chromatography System GA—tiaprofenic acid RI 1976, tiaprofenic acid- Me_2 RI 2180.

High Performance Liquid Chromatography System HAA—retention time 17.6 min; system HX—RI 484; system HY—RI 452; system HZ—retention time 5.8 min.

Ultraviolet Spectrum Ethanolic acid—260 ($A_1^1=370a$), 305 nm ($A_1^1=575a$).

Infrared Spectrum Principal peaks at wavenumbers 1727, 718, 1593, 1198, 1605, 1572 cm^{-1} (Nujol mull).

Quantification

Plasma HPLC UV detection. Tiaprofenic acid enantiomers. Limit of detection, 25 $\mu g/L$ [Geisslinger *et al.* 1996; Vakily, Jamali 1996]. UV detection. Limit of detection, 500 $\mu g/L$ [Ward *et al.* 1982].

Urine GC-MS Tiaprofenic acid and other NSAIDs. Limits of detection, 10 to 50 $\mu g/L$ [Maurer *et al.* 2001].

Disposition in the Body Tiaprofenic acid is rapidly and almost completely absorbed after oral administration. It is metabolised by reduction to 2-(5- α -hydroxybenzyl-2-thienyl)propionic acid, oxidation to 2-(5- p -hydroxybenzoyl-2-thienyl)propionic acid and conjugation with glucuronic acid. About 60% of an oral dose is excreted in the urine in 24 h, about 55% as tiaprofenic acid (excreted mainly as an acylglucuronide conjugate), and about 5% as the two metabolites, excreted partly as acylglucuronides.

Therapeutic Concentration

Following daily oral administration of 300 mg twice a day to 6 subjects, maximum steady-state serum concentrations of 18.6 to 73.3 (mean, 48) mg/L were reported 0.5 to 1.5 h after a dose [Daymond, Herbert 1983].

Half-life Plasma half-life, 1 to 2 h.

Clearance Plasma clearance, about 1.4 $mL/min/kg$.

Protein Binding About 98%.

Note For a review of tiaprofenic acid, see Sorkin and Brogden [1985] and Davies [1996].

Dose 600 mg daily.

Ticlopidine

Antithrombotic

$C_{14}H_{14}ClNS$ = 263.8

CAS—55142-85-3

IUPAC Name 5-[(2-Chlorophenyl)methyl]-6,7-dihydro-4H-thieno[3,2-c]pyridine

Synonym 5-[(2-Chlorophenyl)-methyl]-4,5,6,7-tetrahydrothieno[3,2-c]pyridine

Chemical Properties pK_a , 7.6. Extraction yield, 1 [Demme *et al.* 2005].

Ticlopidine Hydrochloride

$C_{14}H_{14}ClNS \cdot HCl$ = 300.2

CAS—53885-35-1

Proprietary Names Anagregal; Antigreg; Aplaket; Clox; Fluilast; Klodin; Opteron; Parsilid; Thromboline; Thrombopat; Ticlid; Ticlodone; Ticloproge; Ticlosan; Tiklid; Tiklyd.

Chemical Properties A white or almost white crystalline powder. Sparingly soluble in water and in dehydrated alcohol; very slightly soluble in ethyl acetate; practically insoluble in ether.

Gas Chromatography Column: methyl silicone HP1 (0.2 mm i.d., 0.33 μm). Column temperature: 250°. Carrier gas: helium, flow rate 0.9 mL/min . MS detection. RI: 2167 [Mills, Roberson 1996].

Column: 3% OV1 on Gas Chrom Q, 80 to 100 mesh glass (1.8 $m \times 3$ mm i.d.). Column temperature: 252°. Carrier gas: helium, flow rate 30 mL/min . IS: S-(2,4-dichlorophenyl)-4,5,6,7-tetrahydrothieno[3,2-c]pyridine. MS detection (SIM at m/z 110). Retention time: ticlopidine, 70 s; IS, 100 s [Knudsen *et al.* 1992].

High Performance Liquid Chromatography System HAA—retention time 13.8 min.

Column: LC-8-DB Supelcosil (150 \times 4.6 mm i.d., 5 μm); (guard) LC-8-DB Supelguard (20 \times 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : methanol : potassium dihydrogen phosphate (0.05 mol/L, pH 3, containing 0.2% triethylamine) (20 : 25 : 55), flow rate 1 mL/min . UV detection ($\lambda=235$ nm). Retention time: 7.6 min [Dal Bo *et al.* 1995].

Column: ODS Hypersil (100 \times 4.5 mm i.d., 5 μm). Mobile phase: methanol : water : concentrated ammonia solution (80 : 20 : 1), flow rate 1 mL/min . IS: S-(2,4-dichlorophenyl)-4,5,6,7-tetrahydrothieno[3,2-c]pyridine. UV detection ($\lambda=210$ nm). Retention time: ticlopidine, 5.5 min; IS, 10 min [Knudsen *et al.* 1992].

Column: ODS Hypersil (100 \times 4.6 mm i.d., 5 μm). Mobile phase: methanol : dihydrogen potassium phosphate buffer (0.01 mol/L, pH 3.5) (90 : 10), flow rate 1 mL/min . UV detection. Retention time: 2.5 min [Mills, Roberson 1996].

Ultraviolet Spectrum Aqueous acid—214, 231, 268, 275 nm.

Infrared Spectrum Principal peaks at wavenumber 1457, 971, 717 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 110, 263, 125, 262, 265, 264, 111, 89.

Quantification

Plasma GC NPD. Limit of detection, 0.01 mg/L [Shah *et al.* 1991]. NPD. Limit of detection, 0.002 mg/L [Desager *et al.* 1990].

GC-MS Limit of detection, 5 g/L [Knudsen *et al.* 1992].

HPLC UV detection ($\lambda=215$ nm). Limit of quantification, 0.01 mg/L, limit of detection, 0.005 mg/L [Róna *et al.* 1997]. UV detection ($\lambda=235$ nm). Limit of detection, 0.005 mg/L [Dal Bo *et al.* 1995].

Disposition in the Body Ticlopidine is rapidly and almost completely absorbed (80 to 90%) after oral administration. The bioavailability is improved when the drug is administered with food, especially a high-fat meal, and the rate and extent of absorption is slightly improved. Peak plasma concentrations occur after about 2 h. Pharmacokinetics are nonlinear, with clearance decreasing markedly on repeated dosing. The drug is rapidly and extensively metabolised in the liver by *N*-dealkylation and oxidation with a number of highly polar urinary and biliary metabolites, which have not been identified. Further metabolism and conjugation may also occur. Approximately 60% of an administered dose is excreted in urine as metabolites, and 25% is eliminated in faeces. <1% of the drug appears in urine unchanged. Accumulation of the drug may occur with repeated dosing.

Therapeutic Concentration

Administration of a single oral dose of 250 mg to 12 young subjects (mean, 28.6 years) and 13 elderly subjects (mean, 69.5 years) after a light breakfast, resulted in mean peak plasma concentrations of 0.41 and 0.70 mg/L, respectively at 2 h. Administration of 250 mg twice a day for 21 days resulted in mean peak plasma concentrations of 0.89 mg/L in the young group and 1.42 mg/L in the elderly group after 1 and 2 h, respectively [Shah *et al.* 1991].

Twelve healthy male volunteers with a mean age of 32 years were fasted from midnight the evening before and administered with a single dose of 250 mg in a fasted state, 30 min after a high-fat breakfast, or immediately after ingestion of an antacid. The peak concentrations were 0.573 mg/L for the fasted individuals, 0.695 mg/L for the fed individuals and 0.375 mg/L for those who also took antacid. These concentrations were observed 1.917, 1.708 and 2.000 h after administration [Shah *et al.* 1990].

Half-life Plasma half-life, 7.9 h (in young volunteers) and 12.7 h (elderly) after a single dose; 91 h (young) and 98 h (elderly) after repeated dosing.

Protein Binding 98%.

Note For reviews of ticlopidine, see Saltiel and Ward [1987] and McTavish *et al.* [1990].

For a review of the pharmacokinetics of ticlopidine, see Desager [1994].

Tienilic Acid

Diuretic

$C_{13}H_8Cl_2O_4S = 331.2$

CAS—40180-04-9

IUPAC Name 2-[2,3-Dichloro-4-(thiophene-2-carbonyl)phenoxy]acetic acid

Synonyms Thienylic acid; ticrynafen; ANP-3624; CE-3624; SKF-62698.

Proprietary Names *Diflurex*; *Selacryn*.

Chemical Properties A white crystalline powder. Mp 148° to 149°; also reported as 157°. Very slightly soluble in water; soluble 1 in 14 of ethanol, 1 in about 5 of acetone, 1 in 77 of chloroform and 1 in about 6 of methanol. pK_a 2.7 (25°). Log *P* (octanol/water), 3.6.

Ultraviolet Spectrum Ethanol—267 ($A_1^1=343a$), 296 nm ($A_1^1=384a$).

Infrared Spectrum Principal peaks at wavenumbers 1185, 1620, 1075, 1762, 1580, 1290 cm^{-1} (KBr disk).

Quantification

Plasma GC ECD. Tienilic acid and metabolites. Limit of detection, 10 µg/L [Hwang *et al.* 1978].

HPLC UV detection. Tienilic acid and monohydroxy metabolite. Limit of detection, 200 µg/L [Kerremans *et al.* 1982].

Serum GC See Plasma [Hwang *et al.* 1978].

Urine GC See Plasma [Hwang *et al.* 1978].

HPLC Tienilic acid and 5-hydroxy-tienilic acid [Mansuy *et al.* 1984]. See Plasma [Kerremans *et al.* 1982].

Disposition in the Body Tienilic acid is absorbed after oral administration. It is metabolised by hydroxylation and oxidation. About 40% of a dose is excreted in the urine in 24 h; about 20% of the dose is excreted in the urine as unchanged drug, up to 10% as [2,3-dichloro-4-(α -hydroxy-2-thenyl)phenoxy]acetic acid, about 15% as a dihydroxylated metabolite, and 1 to 2% as (2,3-dichloro-4-carboxyphenoxy)acetic acid.

Therapeutic Concentration

After a single oral dose of 250 mg to 8 subjects, mean peak plasma concentrations of 11 mg/L of tienilic acid, 0.7 mg/L of the monohydroxylated metabolite, and 0.07 mg/L of the *p*-carboxy metabolite were attained in 3 to 4 h [Hwang *et al.* 1978].

Following a single oral dose of 250 mg to 8 subjects, peak plasma concentrations of 7.7 to 27.4 (mean, 16) mg/L of tienilic acid were attained in 1 to 2 h [Kerremans *et al.* 1982].

Half-life Plasma half-life, 1.5 to 4 h.

Distribution in Blood Plasma: whole blood ratio, about 1.6.

Protein Binding About 99%.

Dose Tienilic acid has been given in doses of 0.25 to 1 g daily.

Hwang B *et al.* (1978). GLC determination of ticynafen and its metabolites in urine, serum, and plasma of humans and animals. *J Pharm Sci* 67: 1095–1098.

Mansuy D *et al.* (1984). Metabolic hydroxylation of the thiophene ring: isolation of 5-hydroxy-tienilic acid as the major urinary metabolite of tienilic acid in man and rat. *Biochem Pharmacol* 33: 1429–1435.

Tigloidine

Anticholinergic

$C_{13}H_{21}NO_2 = 223.3$

CAS—495-83-0

IUPAC Name (8-Methyl-8-azabicyclo[3.2.1]octan-3-yl) (*E*)-2-methylbut-2-enoate

Synonyms 2-Methyl-2-butenic acid [1 α ,3 α (*E*),5 α]-8-methyl-8-azabicyclo[3.2.1]oct-3-yl ester; tiglylpseudotropeine.

Chemical Properties Tigloidine was first isolated from *Duboisia myoporoides* (*Solanaceae*) but is now synthesised. A thin, syrupy liquid.

Tigloidine Hydrobromide

$C_{13}H_{21}NO_2 \cdot HBr = 304.2$

CAS—22846-83-9

Proprietary Name *Tiglyssin*

Chemical Properties A white crystalline solid. Mp 234° to 235°. Soluble in water and chloroform.

Thin-layer Chromatography System TA— R_f 0.42; system TL— R_f 0.07; system TB— R_f 0.39; system TC— R_f 0.21 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 1687.

High Performance Liquid Chromatography System HA—*k* 3.6 (tailing peak).

Infrared Spectrum Principal peaks at wavenumbers 1700, 1266, 1136, 1036, 1156, 1073 cm^{-1} (thin film).

Mass Spectrum Principal ions at *m/z* 124, 82, 83, 94, 55, 42, 67, 96.

Dose 1 to 2 g of tigloidine hydrobromide daily.

Tiletamine

Anaesthetic, Anticonvulsant

$C_{12}H_{17}NOS = 223.3$

IUPAC Name 2-(Ethylamino)-2-thiophen-2-ylcyclohexan-1-one

Synonym 2-Ethylamino-2-thien-2-ylcyclohexanone

Chemical Properties Tiletamine is extracted by chloroform from aqueous alkaline solutions.

Tiletamine Hydrochloride

Synonyms CL-634; CL-399; CN-54521-2.

Chemical Properties White crystalline powder. Mp 193° to 194°. Soluble in water and chloroform.

Colour Test Vitali's test— $-/$ -blue-green (limit of detection, 1.0 µg).

Thin-layer Chromatography System T1— R_f 0.68 (location reagent acidified iodoplatinate spray, positive reaction).

Gas Chromatography System G2/225—retention time 2.67 relative to diphenhydramine, retention time 0.60 relative to codeine; System G4/225—retention time 2.70 relative to diphenhydramine retention time 0.30 relative to codeine.

Ultraviolet Spectrum 0.1 N sulfuric acid—234 nm ($E_{1\%}^{1\text{cm}}$ 265) (tiletamine hydrochloride).

Infrared Spectrum Principal peaks at wavenumbers 1698, 697, 1116 or 1437 cm^{-1} (tiletamine base) (KBr disk)

Disposition in the Body

Toxicity LD_{50} in mice 95.5 mg/kg (IP).

Tilidate

Narcotic Analgesic

$C_{17}H_{23}NO_2 = 273.4$

CAS—20380-58-9

IUPAC Name Ethyl (1*S*,2*R*)-2-(dimethylamino)-1-phenylcyclohex-3-ene-1-carboxylate

Synonyms (1*R*,2*S*)-*rel*-2-(Dimethylamino)-1-phenyl-3-cyclohexene-1-carboxylic acid ethyl ester; tilidine.

Chemical Properties Log *P* (octanol/water), 3.7. Extraction yield (chlorobutane), 1 (tilidine) [Demme *et al.* 2005].

Tilidate Hydrochloride

$C_{17}H_{23}NO_2 \cdot HCl \cdot H_2O = 318.8$

CAS—27107-79-5 (anhydrous)

Proprietary Names *Findol N*; *Tili*; *Tilicomp*; *Tilidalor*; *Tilidin*; *Tiligetic*; *Tilimerck*; *Tilitrate*; *tilnalox*; *Valoron*; *Valtran*.

Chemical Properties A white crystalline powder. Mp 125°. Soluble in water.

Thin-layer Chromatography System TAE— R_f 0.61; system TE— R_f 0.84.

Gas Chromatography System GA—tilidate RI 1838, bisnortilidate RI 1827, nortilidate RI 1830.

High Performance Liquid Chromatography System HY—RI 290.

Ultraviolet Spectrum Aqueous acid—251 nm ($A_1^1 = 6.2b$), 257 nm ($A_1^1 = 7.6b$), 262 nm ($A_1^1 = 6.1b$).

Infrared Spectrum Principal peaks at wavenumbers 1714, 1238, 1182, 1263, 1167, 703 cm^{-1} (tilidate hydrochloride; see below).

Mass Spectrum Principal ions at m/z 103, 77, 82, 29, 97, 42, 51, 104 (tilidate); 69, 68, 70, 77, 103, 56, 54, 51 (bisnortilidate); 83, 68, 82, 72, 84, 77, 103, 115 (nortilidate).

Quantification

Plasma GC Column: Chrompack Sil-19 (25 m × 0.22 mm i.d., 0.2 μm). Carrier gas: He, 0.8 bar. Temperature programme: 160° for 2 min to 225° at 5°/min for 10 min. NPD. Limit of detection, 6 μg/L [Cordonnier *et al.* 1987a]. Column: 3% OV25 on GasChrom Q 80/100 mesh (1.8 m × 2 mm i.d.). Carrier gas: N₂, 20 mL/min. Temperature: 220°. Retention time: 8.2 and 9.2 min for (+)- and (-)-nortilidate, respectively. Limit of detection, 25 ng for (+)- or (-)-nortilidate [Hengy *et al.* 1978a]. Column: 1% CRS 101 and 1.5% LAC-4-R-886 on 80/100 mesh GasChrom Q (1.8 m × 2 mm i.d.). Carrier gas: N₂, 20 mL/min. Temperature: 165°. NSD. Retention time: 3.7 min. Limit of detection, 1 μg/L [Hengy *et al.* 1978b].

GC-MS See GC. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 10 μg/L [Cordonnier *et al.* 1987a].

LC-MS Column: Phenomenex C₁₂ MAX-RP (150 × 2 mm i.d., 4 μm). Mobile phase: water-acetonitrile (90:10) with 5 mmol/L ammonium formate (pH 3.5); water-acetonitrile (10:90) with 5 mmol/L ammonium formate (pH 3.5, 100:0 for 5 min to 0:100 at 19 min for 7 min to 100:0 in 3 min for 6 min), flow rate 200 μL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.8 μg/L, limit of detection, 0.2 μg/L [Mushhoff *et al.* 2006].

Urine GC See Plasma [Hengy *et al.* 1978a; Hengy *et al.* 1978b].

Hair LC-MS Phenomenex C₁₂ Synergi Max-RP (150 × 2 mm i.d., 4 μm). Mobile phase: water-acetonitrile (90:10) with 5 mmol/L ammonium formate (pH 3.5); water-acetonitrile (10:90) with 5 mmol/L ammonium formate (pH 3.5, 100:0 for 5 min to 0:100 at 19 min for 7 min to 100:0 in 3 min for 6 min), flow rate 200 μL/min. TIS, ESI, positive ion mode. Limit of quantification, 8.7 pg/mg, limit of detection, 2.4 pg/mg [Mushhoff *et al.* 2007].

Disposition in the Body Tilidate is rapidly and almost completely absorbed after oral administration. It is rapidly metabolised by *N*-demethylation to form nortilidate and bisnortilidate; these metabolites may then be conjugated with glucuronic acid. CYP3A4 and CYP2C19 have been identified as the main isoforms responsible for the elimination of tilidate [Weiss *et al.* 2008]. Approximately 80% of an oral dose is excreted in the urine in 24 h, with less than 0.1% of a dose as unchanged drug, approx. 1.5% as nortilidate, 2.5% as bisnortilidate and the rest as unknown metabolites. Up to 10% may be eliminated in the faeces.

Therapeutic Concentration

Eight patients with severe hepatic impairment were administered 100 mg tilidate. The maximum tilidate concentration varied from 66 to 290 μg/L, with a mean of 139 μg/L. The elimination half-lives ranged between 2.1 and 19.8 h with a mean of 8.5 h [Brennscheidt *et al.* 2007].

Following a single oral dose of 50 mg in one subject, peak plasma concentrations of 0.127 mg/mL (+)-nortilidate and 0.121 mg/mL (-)-nortilidate were attained in ~2 h [Hengy *et al.* 1978b].

Toxicity

In a fatal intoxication involving the ingestion of an unknown quantity of tilidate by a 29-year-old man, the postmortem tissue concentrations of tilidate, nortilidate and bisnortilidate, respectively, were as follows: blood 1.74, 4.41 and 0.15 mg/L; lung 5.75, 21.70 and 2.12 μg/g; liver 9.40, 13.70 and 3.51 μg/g; bile 2.88, 6.54 and 0.90 mg/L; kidney 2.78, 12.30 and 2.01 μg/g; urine 0.94, 6.75 and 4.10 mg/L [Cordonnier *et al.* 1987b].

A 28-year-old woman had a serum tilidate concentration of 38.1 mg/L 3 h after ingesting 100 mL of a preparation containing 6.94 g tilidate (and approx. 0.56 g naloxone) in a suicide attempt; the concentration of nortilidate was 18.8 mg/L [Regenthal *et al.* 1998].

Half-life After oral dosing, 3.3 h; after IV administration, 4.9 h; after multiple dosing, 3.6 h [Vollmer *et al.* 1989].

Dose The equivalent of up to 400 mg of the anhydrous hydrochloride daily.

Tilmicosin

Antibacterial (Veterinary)

C₄₆H₈₀N₂O₁₃ = 869.2

CAS—108050-54-0

IUPAC Name (5S,6S,7R,9R,11E,13E,15R,16R)-6-[(2R,3R,4S,5S,6R)-4-(Dime-thylamino)-3,5-dihydroxy-6-methyloxan-2-yl]oxy-7-[2-(3,5-dimethylpiperidin-1-yl)ethyl]-16-ethyl-4-hydroxy-15-[[2-(2R,3R,4R,5R,6R)-5-hydroxy-3,4-dimethoxy-6-methyloxan-2-yl]oxymethyl]-5,9,13-trimethyl-1-oxacyclohexadeca-11,13-diene-2,10-dione

Synonyms 4^A-O-De(2,6-dideoxy-3-C-methyl-α-L-ribo-hexopyranosyl)-20-deoxy-20-(3,5-dimethyl-1-piperidinyl)tylosin; EL-870; LY-177370.

Proprietary Names Micotil; Pulk motil.

Chemical Properties Tilmicosin contains not less than 85% C₄₆H₈₀N₂O₁₃, calculated on an anhydrous basis. The content of tilmicosin *cis*-isomers is between 82% and 88%, and the content of tilmicosin *trans*-isomers is between 12% and 18%. pK_a (25°) 8.18. Log P (octanol/water), 3.80.

High Performance Liquid Chromatography Column: RP18 Lichrospher (125 × 4 mm i.d., 5 μm). Mobile phase: acetonitrile: methanol: trifluoroacetic acid (0.1%) in water (20:20:60 to 25:55:20 in 10 min), flow rate 0.5 mL/min. Detection: MS-MS (NCl: isotopic M⁺, m/z → 869; M⁺, m/z → 868; isotopic, m/z → 678). Retention time: 5.7 min [Delepine *et al.* 1996].

Ultraviolet Spectrum Aqueous solution—283 nm.

Infrared Spectrum Principal peaks at wavenumber 1592, 1167, 1141, 1081, 1058 cm^{-1} (acetate).

Quantification

Serum HPLC Limit of detection, 0.05 mg/L [Moran *et al.* 1997].

Disposition in the Body

Toxicity May be fatal in humans.

There are 36 cases of accidental exposure where less than 1 mL was given. All medical outcomes were benign [McGuigan 1994].

Delepine B *et al.* (1996). Multiresidue method for confirmation of macrolide antibiotics in bovine muscle by liquid chromatography/mass spectrometry. *JAOAC Int* 79: 397–404.

Tiludronic Acid

Bone Resorption Inhibitor

$\text{C}_7\text{H}_9\text{ClO}_6\text{P}_2\text{S} = 318.6$

CAS—89987-06-4

IUPAC Name [(4-Chlorophenyl)sulfanyl-phosphonomethyl]phosphonic acid

Synonyms ACPMD; Cl-TMBP; [[(4-chlorophenyl)thio]methylene]bisphosphonic acid; ME-3737; SR-41319; tiludronate.

Proprietary Name *Skelid*

Disodium Tiludronate

$\text{C}_7\text{H}_7\text{ClNa}_2\text{O}_6\text{P}_2\text{S} = 362.6$

CAS—149845-07-8 (anhydrous); 155453-10-4 (hemihydrate)

Synonyms Disodium dihydrogen; SR-41319B; Tiludronate disodium.

Proprietary Name *Skelid*

Chemical Properties Mp 253°.

High Performance Liquid Chromatography Column: PRP-1 Hamilton (5 μm , 150 \times 4.1 mm i.d.). Mobile phase: tetrabutyl ammonium phosphate (0.005 mol/L)-sodium hydrogen phosphate (0.05 mol/L):acetonitrile, (pH 11.8) (87:13), flow rate 1.0 mL/min. UV detection ($\lambda = 280 \text{ nm}$). Retention time: 2.5 min [Fels *et al.* 1988].

Ultraviolet Spectrum

Quantification

Plasma HPLC Limit of quantification, 0.05 mg/L [Fels *et al.* 1988].

Urine HPLC Limit of quantification, 0.2 mg/L, see Plasma [Fels *et al.* 1988].

Disposition in the Body The drug is rapidly absorbed following oral administration and is absorbed as the free acid. Absorption is decreased by food, especially by products containing calcium or other polyvalent cations. Approximately half of the absorbed portion is bound to bone, and is only very slowly excreted. The remainder is excreted unchanged in urine. After an IV dose, ~50% of a dose is excreted in urine over 13 days. Peak plasma concentrations are reached within 1 to 2 h but are below the limit of detection within 24 h. Steady state is achieved within 9 to 12 days. Concentration of the drug in the bone continues to increase for around 30 days.

Therapeutic Concentration

Twelve healthy individuals were administered with 400 mg tiludronate 1 h after an antacid containing aluminium and magnesium hydroxide was administered. Peak plasma concentrations were 3.35, 1.59 and 2.90 mg/L for

the three dosing regimens observed at 1.7, 1.3 and 1.9 h, respectively [Sansom *et al.* 1995].

Bioavailability Approximately 6% in the fasting state. Reduced by 90% when administered within 2 h of food.

Half-life 40 to 150 h.

Volume of Distribution 30 to 60 L.

Clearance Plasma, 1.3 L/h.

Distribution in Blood Binding to red blood cells is <5% of the total concentration.

Protein Binding 90%, mainly to albumin.

Dose 400 mg daily for 3 months.

Fels JP *et al.* (1988). Determination of (4-chlorophenyl)thiomethylene bisphosphonic acid, a new bisphosphonate, in biological fluids by high-performance liquid chromatography. *J Chromatogr* 430: 73–79.

Sansom LN *et al.* (1995). Human pharmacokinetics of tiludronate. *Bone* 17(5): 479S–483S.

Timolol

β -Blocker

$\text{C}_{13}\text{H}_{24}\text{N}_4\text{O}_3\text{S} = 316.4$

CAS—26839-75-8

IUPAC Name (2S)-1-(Tert-butylamino)-3-[(4-morpholin-4-yl)-1,2,5-thiadiazol-3-yl]oxy]propan-2-ol

Synonym (2S)-1-[(1,1-Dimethylethyl)amino]-3-[[4-(4-morpholinyl)-1,2,5-thia-diazol-3-yl]oxy]-2-propanol

Chemical Properties Log P (octanol/water), 1.8. Extraction yield, 0.6 [Demme *et al.* 2005].

Timolol Maleate

$\text{C}_{13}\text{H}_{24}\text{N}_4\text{O}_3\text{S}_2\text{C}_4\text{H}_4\text{O}_4 = 432.5$

CAS—26921-17-5

Synonym MK-950

Proprietary Names *Aquanil; Betim(ol); Blocadren; Cusimolol; Dispatim; Glauopt; Glaucol; Nyogel; Nyolol; Oftamolol; Oftan; Optimol; Timabak; Timacor; Timofal; Timoptic; Timoptol; Timosil.* It is an ingredient of *Cosopt, Moducron* and *Prestim.*

Chemical Properties A white crystalline powder. Mp 201.5° to 202.5°. Soluble in water, ethanol and methanol; sparingly soluble in chloroform; practically insoluble in ether.

Colour Test Liebermann's reagent (100°)—violet.

Thin-layer Chromatography System TA— R_f 0.52; system TB— R_f 0.06; system TC— R_f 0.11; system TE— R_f 0.50; system TL— R_f 0.09; system TAE— R_f 0.20; system TAF— R_f 0.75.

Gas Chromatography System GA—timolol RI 2266, timolol-Art RI 2275; system GB—timolol RI 2373, timolol-Art RI 2380.

High Performance Liquid Chromatography System HA— k 1.2; system HAA—retention time 10.3 min; system HX—RI 317; system HY—RI 250; system HZ—retention time 2.1 min.

Ultraviolet Spectrum Aqueous acid—295 nm ($A_1^1 = 279\text{a}$). No alkaline shift.

Infrared Spectrum Principal peaks at wavenumbers 1497, 1527, 1120, 1230, 1590, 1620 cm^{-1} (timolol maleate, KBr disk).

Mass Spectrum Principal ions at m/z 30, 86, 57, 129, 74, 56, 41, 114.

Quantification

Plasma GC ECD. Limit of detection, 2 µg/L [Tocco *et al.* 1975].

GC-MS Limit of detection, 5 µg/L [Fourtillan *et al.* 1981a].

HPLC Timolol and other beta-blockers. Limit of detection, 4 to 27 µg/L [Tracqui *et al.* 1988; 1989]. ECD [Gregg, Jack 1984]. UV detection. Limit of detection, 40 µg/L [Lefebvre *et al.* 1981].

HPLC-MS Limit of detection, 0.5 µg/L [Olah *et al.* 1993].

Serum HPLC-GC Timolol and other beta-blockers. Limit of detection, 18 to 44 µg/L [Hyotylainen *et al.* 1997].

Urine GC Limit of detection, 20 µg/L, see Plasma [Tocco *et al.* 1975].

GC-MS See Plasma [Fourtillan *et al.* 1981a].

HPLC Amperometric detection. Timolol and other beta-blockers. Limit of detection, 15 ppb to 500 ppb [Maguregui *et al.* 1995]. See Plasma [Lefebvre *et al.* 1981; Tracqui *et al.* 1988; Tracqui *et al.* 1989].

HPLC-GC See Serum [Hyotylainen *et al.* 1997].

Electrophoresis UV detection. Limit of detection, 190 µg/L [Maguregui *et al.* 2002].

Breast Milk HPLC See Plasma [Gregg, Jack 1984].

Hair GC Timolol and other beta-blockers. Limit of detection, 2 to 10 ng/g [Kintz *et al.* 2000].

Disposition in the Body Timolol is almost completely absorbed after oral administration. It is metabolised mainly by oxidation and hydrolytic cleavage of the morpholine ring. About 70% of a dose is excreted in the urine in 24 h, with about 20% of the dose as unchanged drug.

Therapeutic Concentration

After a single oral dose of 20 mg to 5 subjects, peak plasma concentrations of 0.05 to 0.11 (mean, 0.08) mg/L were attained in 0.5 to 3 h [Fourtillan *et al.* 1981b].

Following daily oral administration of 15 mg three times a day to 8 subjects, maximum steady-state plasma concentrations of 0.04 to 0.23 (mean, 0.11) mg/L were reported [Singh *et al.* 1980].

One, two or three patches, each releasing 97.5 mg timolol, were applied at weekly intervals to subjects' inner arm for 48 h and produced mean plasma timolol concentrations of 5, 11 and 14 µg/L, respectively. A study of suppression of exercise heart rate and plasma timolol concentrations showed the 50% inhibitory concentration of timolol to be 2 to 4 µg/L [McCrea *et al.* 1990].

Bioavailability 50 to 75%.

Half-life Plasma half-life, about 2 to 6 h.

Volume of Distribution 1 to 3 L/kg.

Clearance Plasma clearance, about 5 to 10 mL/min/kg.

Dose 10 to 60 mg of timolol maleate daily.

Tinidazole

Antiprotozoal

$C_8H_{13}N_3O_4S = 247.3$

CAS—19387-91-8

IUPAC Name 1-(2-Ethylsulfonyl)ethyl-2-methyl-5-nitroimidazole

Synonym CP-12574

Proprietary Names Amebysol; Ametricid; Amplium; Asiazole-TN; Dyzole; Estovyn-T; Fa-Cyl; Fasigin; Fasigyn(e); Funida; Ginosutin; Idazole; Pletil; Protocide; Simplotan; Sorquetan; Sporinex; Tini; Tonid; Trichonas; Tricolam; Trimonase; Trinizol; Triseptil.

Chemical Properties Colourless crystals. Mp 127° to 128°. Practically insoluble in water; soluble in acetone; sparingly soluble in methanol. Log *P* (octanol/water), -0.4.

Gas Chromatography System GA—RI 2024.

High Performance Liquid Chromatography System HAA—retention time 10.6 min.

Ultraviolet Spectrum Aqueous acid—277 nm ($A_1^1=245b$); methanol—230 ($A_1^1=148b$), 311 nm ($A_1^1=354b$).

Quantification

Plasma GC AFID. Limit of detection, 100 µg/L [Laufen *et al.* 1979].

Serum HPLC UV/vis detection. Limit of detection, 50 µg/L [Rajnarayana *et al.* 2002]. Limit of detection, 300 µg/L [Nilsson-Ehle *et al.* 1981].

Urine HPLC Limit of detection, 600 µg/L, see Serum [Nilsson-Ehle *et al.* 1981].

Tissues GC Limit of detection, 50 ng/g, see Plasma [Laufen *et al.* 1979].

Disposition in the Body Tinidazole is well absorbed after oral administration. It is excreted in the bile. About 25% of a dose is excreted in the urine unchanged in 72 h together with small amounts of 2-hydroxymethyltinidazole and its glucuronide.

Therapeutic Concentration

Following a single oral dose of 2 g to 3 subjects, peak serum concentrations of 35.7, 35.7 and 46.3 mg/L were attained in 2 to 3 h; serum concentrations of 0.19, 0.24 and 0.46 mg/L of the hydroxymethyl metabolite were reported, 6 h after the dose [Robson *et al.* 1984].

A single oral dose of 2 g in 10 subjects produced serum tinidazole concentrations of 3.2 to 46.5 mg/L (concentrations in gingival crevicular fluid were similar); 24 h after the dose, the mean serum tinidazole concentration was 13 ± 3 mg/L [Liew 1991].

Bioavailability >90%.

Half-life Plasma half-life, about 12 to 17 h.

Volume of Distribution About 0.7 L/kg.

Clearance Plasma clearance, about 0.6 mL/min/kg.

Protein Binding About 12%.

Note For a review of tinidazole, see Carmine *et al.* [1982].

Dose Usually 2 g initially, orally, followed by 1 g daily.

Chemical Properties A pale yellow crystalline powder. Mp >360°. Practically insoluble in water, ethanol and chloroform; freely soluble in dilute solutions of alkali hydroxides. Log P (octanol/water), –0.1.

Ultraviolet Spectrum Aqueous acid—258 (A₁¹=490b), 348 nm (A₁¹=1240a); aqueous alkali—320 nm (A₁¹=1015b).

Infrared Spectrum Principal peaks at wavenumbers 1625, 1668, 1257, 1539, 1231, 971 cm⁻¹ (KBr disk).

Quantification

Plasma Spectrofluorimetry Limit of detection, 5 µg/L [Dooley, Maddocks 1980].

HPLC [Rudy *et al.* 1988]. UV detection. Tioquanine and metabolites. Limit of detection, about 130 µg/L [Andrews *et al.* 1982]. UV detection. Limit of detection, 200 µg/L [Breithaupt, Goebel 1981].

Urine HPLC See Plasma [Rudy *et al.* 1988]; [Breithaupt, Goebel 1981].

Cerebrospinal Fluid HPLC See Plasma [Rudy *et al.* 1988].

Disposition in the Body Tioquanine is incompletely and variably absorbed after oral administration. It is rapidly activated by intracellular conversion to thioguaninic acid. It is inactivated by methylation to aminomethylthiopurine and by deamination to thioxanthine. About 40% of an oral dose is excreted in the urine as metabolites in 24 h; only traces of tioquanine have been detected.

Dose Initially 2 to 2.5 mg/kg daily.

Tiocarlide

Tuberculostatic

C₂₃H₃₂N₂O₂S = 400.6

CAS—910-86-1

IUPAC Name 1,3-Bis[4-(3-methylbutoxy)phenyl]thiourea

Synonyms Thiocarlide; DATC

Proprietary Names *Disocarban*; *Datamil*; *Isoxyl*

Chemical Properties A white crystalline powder. Mp 134° to 145°. Practically insoluble in water; soluble in ethanol and chloroform. Log P (octanol/water), 7.2.

Colour Tests Liebermann's reagent—green; Mandelin's test—green→yellow.

Thin-layer Chromatography System TA—R_f 0.80; system TB—R_f 0.07; system TC—R_f 0.78; system TL—R_f 0.72 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2005.

Infrared Spectrum Principal peaks at wavenumbers 1228, 1499, 1534, 823, 1163, 1285 cm⁻¹ (KBr disk).

Mass Spectrum Principal ions at *m/z* 109, 151, 43, 41, 221, 179, 29, 108.

Dose 6 g daily.

Tioguanine

Antineoplastic

C₅H₅N₅S = 167.2

CAS—154-42-7 (anhydrous); 5580-03-0 (hemihydrate)

IUPAC Name 2-Amino-3,7-dihydropurine-6-thione

Synonyms 2-Amino-1,7-dihydro-6H-purine-6-thione; 6-TG; thioguanine.

Proprietary Name *Janvis*

Tiotixene

Tranquilliser

C₂₃H₂₉N₃O₂S₂ = 443.6

CAS—5591-45-7; 3313-26-6 (Z)

IUPAC Name (9Z)-N,N-Dimethyl-9-[3-(4-methylpiperazin-1-yl)propylidene]thioxanthene-2-sulfonamide

Synonyms N,N-Dimethyl-9-[3-(4-methyl-1-piperazinyl)propylidene]thioxanthene-2-sulfonamide; thiothixene.

Proprietary Names *Navane* (capsules and tablets); *Orbinamon*.

Chemical Properties A white to tan-coloured crystalline powder. Mp 147° to 149°. Practically insoluble in water; soluble 1 in 110 of dehydrated alcohol, 1 in 2 of chloroform and 1 in 120 of ether; slightly soluble in acetone and in methanol. Log P (octanol/water), 3.8.

Tiotixene Hydrochloride

C₂₃H₂₉N₃O₂S₂·2HCl·2H₂O = 552.6

CAS—58513-59-0 (anhydrous); 49746-04-5 (anhydrous, Z); 22189-31-7 (dihydrate); 49746-09-0 (dihydrate, Z)

Proprietary Names *Navane* (oral concentrate); *Thixit*.

Chemical Properties A white crystalline powder. Soluble 1 in 8 of water, 1 in 270 of dehydrated alcohol and 1 in 280 of chloroform; practically insoluble in acetone, in ether and in benzene.

Colour Tests Formaldehyde-sulfuric acid—red; Liebermann's reagent—red; Mandelin's test—red; Marquis test—red; sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.49; system TAE—tiotixene R_f 0.26, M R_f 0.12; system TAF—R_f 0.24; system TL—R_f 0.07; system TB—R_f 0.10; system TC—R_f 0.40; system TE—tiotixene R_f 0.44, M R_f 0.36; system TAJ—R_f 0.19; system TAK—R_f 0.05; system TAL—R_f 0.71 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 3060.

High Performance Liquid Chromatography System HA—*k* 3.8; system HX—RI 442; system HY—RI 374; system HZ—retention time 6.8 min.

Ultraviolet Spectrum Aqueous acid—308 nm (A₁¹=191a).

Infrared Spectrum Principal peaks at wavenumbers 1156, 719, 765, 1176, 957, 747 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 113, 70, 114, 42, 221, 222, 56, 43.

Quantification

Plasma GC-MS Limit of detection, $<1 \mu\text{g/L}$ [Hobbs *et al.* 1974].

HPLC Coulometric detection. *cis*-tiotixene. Limit of detection, 200 ng/L [Hariharan *et al.* 1991]. UV detection. *cis*- and *trans*-tiotixene [Bogema *et al.* 1982].

Serum HPLC UV detection. Limit of detection, 0.05 $\mu\text{g/L}$ [Dilger *et al.* 1988].

Disposition in the Body Tiotixene is rapidly absorbed after oral administration. The *N*-desmethyl derivative accounts for about 10% of the plasma concentration; other unidentified metabolites may accumulate on chronic administration.

Therapeutic Concentration

Following chronic oral administration of 15 to 60 mg daily in divided doses to 15 subjects, plasma concentrations, determined 2 to 2½ h after the last daily dose, were in the range 0.010 to 0.023 (mean, 0.016) mg/L [Hobbs *et al.* 1974].

A study in 42 schizophrenic patients showed that a median plasma concentration of 12 to 15 $\mu\text{g/L}$ might be expected with a daily dose of 60 mg of tiotixene [Hollister *et al.* 1987].

Toxicity

In a fatality involving the ingestion of 250 mg of tiotixene and an unknown quantity of doxepin, a postmortem blood concentration of 0.13 mg/L of tiotixene was reported [Baselt 2000].

A blood concentration of 0.53 mg/L was detected in acute overdosage with tiotixene before it declined to 0.047 mg/L in 12 h [Kemal, Imami 1985].

Half-life Plasma half-life, about 34 h.

Dose Usually 10 to 30 mg daily; up to 60 mg daily may be given.

Tiotropium

Anticholinergic, Antimuscarinic, Quaternary Ammonium

$\text{C}_{19}\text{H}_{22}\text{NO}_4\text{S}_2 = 391.5$

CAS—186691-13-4

Synonym 6 β ,7 β -Epoxy-3 β -hydroxy-8-methyl-1 α H,5 α H-tropanium di-2-thienylglycolate

Tiotropium Bromide

$\text{C}_{19}\text{H}_{22}\text{BrNO}_4\text{S}_2 = 472.4$

CAS—139404-48-1 (anhydrous or hydrate); 136310-93-5 (anhydrous); 411207-31-3 (monohydrate)

IUPAC Name 6 β ,7 β -Epoxy-3 β -hydroxy-8-methyl-1 α H,5 α H-tropanium bromide di-2-thienylglycolate

Synonyms Ba-679; Ba-679BR.

Proprietary Names *Spiriva*. It is also an ingredient in *Duova*.

Chemical Properties Sparingly soluble in water; Mp 218° to 220°. Log *P* (octanol/water), -0.86 [Wishart 2006].

Mass Spectrum Principal ions at m/z 392, 152, 170.

Quantification

Plasma HPLC Column: C_8 . Mobile phase: acetonitrile : 8 mmol/L 1-heptane sulfonic acid (pH 3.2; 330 : 700). UV detection ($\lambda = 240 \text{ nm}$). Limit of quantification not reported [Brand *et al.* 2007].

LC-MS Column: C_{18} (150 \times 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 10 mmol/L ammonium acetate buffer-1% formic acid (40 : 60), flow rate 0.8 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 2.4 min. Limit of quantification, 0.5 ng/L; limit of detection, 0.1 ng/L [Wang *et al.* 2007]. Column: C_{18} (125 \times 1.6 mm i.d., 5 μm). Mobile phase: 1.36 mL triethanolamine in 800 mL water, pH 2.0 with phosphoric acid and 1.92 g pentanesulfonic acid sodium salt made up to 1 L water and diluted 1 : 100 (A) : 800 mL acetonitrile and 200 mL A (pH 3.0 with 9.6 g pentanesulfonic acid sodium salt; 60 : 40 to 20 : 80). API, SRM acquisition mode. Limit of quantification, 2.43 ng/L [Türck *et al.* 2004].

Urine LC-MS See Plasma [Türck *et al.* 2004].

Disposition in the Body On inhalation of the dry powder, some tiotropium bromide is absorbed from the lung. It is non-enzymatically cleaved to the inactive *N*-methylscopine and dithienylglycolic acid compounds. Human *in vitro* studies suggest that 25% of a dose may be metabolised by CYP2D6 and CYP3A4, with subsequent glutathione conjugation into a variety of phase II metabolites. It is excreted largely unchanged in the urine.

Therapeutic Concentration

Twenty subjects (5 healthy volunteers and 15 patients with varying degree of chronic obstructive pulmonary disease [COPD]) were administered a daily dose of 18 μg tiotropium as a dry powder inhalation formulation for 14 days.

Mean peak plasma tiotropium concentrations on day 14 were reported as follows:

Subjects	C_{max} (ng/L)
Healthy	7.50
Mild COPD	16.2
Moderate COPD	12.4
Severe COPD	13.5

[Brand *et al.* 2007].

Twenty-four subjects (6 healthy volunteers, 18 patients with varying degree of renal impairment) were administered a single IV dose of 4.8 μ g tiotropium. Mean peak plasma concentrations of tiotropium and other pharmacokinetic parameters were reported as follows:

Parameter	Renal function			
	Normal	Mild impairment	Moderate impairment	Severe impairment
C_{max} (ng/L)	147	200	223	223
Half-life (days)	4	5	4	6
Total clearance (mL/min)	831	465	345	249
Volume of distribution (L)	2703	2209	1427	1659

[Türk *et al.* 2004].

Toxicity Since such a small part of a dose is eliminated through enzymatic metabolism, clinically relevant drug interactions are not expected.

Bioavailability Approximately 20% with inhalation powder and 2.5% with oral solution.

Half-life Between 5 and 6 days.

Volume of Distribution Approximately 32 L/kg, varies with renal impairment, see Türk *et al.* [2004].

Protein Binding Approximately 72%.

Note For a review of tiotropium bromide, see Hvizdos and Goa [2002].

Dose Given as inhalation powder in capsules containing 22.5 μ g tiotropium bromide monohydrate, equivalent to 18 μ g of tiotropium, and supplying 10 μ g of tiotropium from the mouthpiece of the inhaler device. The contents of one capsule are inhaled daily, at the same time each day.

Tirofiban

Antithrombotic

$C_{22}H_{36}N_2O_5S = 440.6$

CAS—144494-65-5

IUPAC Name (2S)-2-(Butylsulfonylamino)-3-[4-(4-piperidin-4-ylbutoxy)phenyl]propanoic acid

Synonym N-(Butylsulfonyl)-O-[4-(4-piperidinyl)butyl]-L-tyrosine

Chemical Properties A white solid. Mp 223° to 225°.

Tirofiban Hydrochloride Monohydrate

$C_{22}H_{36}N_2O_5S \cdot HCl \cdot H_2O = 495.1$

CAS—142373-60-2 (anhydrous); 150915-40-5 (monohydrate)

Synonyms L-700462; MK-0383; MK-383.

Proprietary Name Aggrastat

Chemical Properties A white to off-white, non-hygroscopic, free-flowing powder. Mp 131° to 132°. Very slightly soluble in water.

Ultraviolet Spectrum

Quantification

Plasma HPLC-MS Column: RX-C₁₈ Zorbax (250 × 4.6 mm i.d., 5 μ m). Mobile phase: acetonitrile: 1 mmol/L ammonium acetate (pH 6.0, 41.5:58.5), flow rate 1 mL/min. IS: L-702, 128. Detection: MS-MS (Aggrastat, m/z 535 → 415; IS, m/z 555 → 141). Retention time: Tirofiban, 5.2 min; IS, 5.1 min. Limit of quantification, 0.4 μ g/L [Ellis *et al.* 1997].

Disposition in the Body Tirofiban is mainly cleared from plasma by renal excretion. Approximately 65% of a dose is recovered in urine and 25% in faeces mainly as the unchanged drug. Metabolism is limited.

Therapeutic Concentration

Eighteen healthy males were administered 0.05, 0.10, 0.15, 0.25 and 0.40 μ g/kg/min doses of tirofiban hydrochloride as a 1 h infusion. A separate group of 20 healthy males were administered 0.10, 0.15 and 0.20 μ g/kg/min doses as a 4 h infusion. The peak plasma concentrations after the 1 h infusion were 5.4, 10.9, 12.0, 30.1 and 47.8 μ g/L for the 5 doses and after the 4 h infusion, 20.7, 42.2 and 42.6 μ g/L for the 0.10, 0.15 and 0.20 μ g/kg/min doses, respectively. As part of the study, the volunteers were administered 0.15 μ g/kg/min tirofiban hydrochloride as a 4 h infusion with 325 mg aspirin administered the day before treatment and approximately 1 h before the tirofiban dose. The peak concentration of tirofiban was 29.3 μ g/L [Barrett *et al.* 1994].

Toxicity Overdosing may result in bleeding, primarily minor mucocutaneous bleeding and minor bleeding at the sites of cardiac catheterisation. Tirofiban has also been associated with a higher incidence of thrombocytopenia.

Half-life 1.2 to 2.0 h.

Volume of Distribution Steady state, 22 to 42 L.

Clearance Plasma, 213 to 329 mL/min; 152 to 267 mL/min in patients with coronary artery disease. This value is decreased further in elderly patients, and is reduced in patients with severe renal insufficiency (creatinine clearance, <30 mL/min) by ~50%.

Protein Binding Not highly bound.

Dose IV infusion, 0.4 μ g/kg/min initially for 30 min followed by 0.1 μ g/kg/min for at least 48 h (continued during and for 12 to 24 h after percutaneous coronary intervention). Maximum duration is 108 h.

Barrett JS *et al.* (1994). Pharmacokinetics and pharmacodynamics of MK-383, a selective non-peptide platelet glycoprotein-IIb/IIIa receptor antagonist, in healthy men. *Clin Pharmacol Ther* 56: 377–388.

Ellis JD *et al.* (1997). Use of LC-MS/MS to cross-validate a radioimmunoassay for the fibrinogen receptor antagonist, Aggrastat (tirofiban hydrochloride) in human plasma. *J Pharm Biomed Anal* 15(5): 561–569.

Tizanidine

α_2 -Adrenoceptor Agonist, Muscle Relaxant

$C_9H_8ClN_5S = 253.7$

CAS—51322-75-9

IUPAC Name 6-Chloro-N-(4,5-dihydro-1H-imidazol-2-yl)-2,1,3-benzothiadiazol-7-amine

Synonyms AN-021; 5-chloro-N-(4,5-dihydro-1H-imidazol-2-yl)-2,1,3-benzothiadiazol-4-amine; DS-103-282; DS-103-282-ch.

Proprietary Names Sirdalud; Temelin; Zanaflex.

Chemical Properties A white to off white fine crystalline odourless powder with Mp 221° to 223°. It is slightly soluble in water and methanol. Stable in plasma

at room temperature and in the autosampler for 24 h, after 3 freeze-thaw cycles and for 24 days when stored below -50° . Stock solutions were stable at room temperature for 4 h, 21 h and after refrigeration at -4° for 2 months [Nirogi *et al.* 2006].

Tizanidine Hydrochloride

$C_9H_9ClN_5S \cdot HCl = 290.2$

CAS—64461-82-1

Chemical Properties A white to off white fine crystalline odourless powder. It is slightly soluble in water and methanol. Its solubility in water decreases as the pH increases.

Thin-layer Chromatography System TAE— R_f 0.51; system TB— R_f 0.04; system TE— R_f 0.56.

High Performance Liquid Chromatography System HX—RI 247; system HZ—RT 2.3 min.

Column: Spherisorb ODS (150×4.6 mm i.d., $0.5 \mu\text{m}$). Mobile phase: 1% TEA (pH 2.5): acetonitrile (55:45), flow rate 0.8 mL/min. UV detection ($\lambda = 303$ nm). Retention time: 1.6 min. Limit of quantification, $80 \mu\text{g/L}$, limit of detection, $10 \mu\text{g/L}$ [Gandhimathi *et al.* 2005].

Column: Kromasil C_{18} (250×4.6 mm i.d., $5.0 \mu\text{m}$) or Finepak SIL-5 C_{18} (250×4.6 mm i.d., $5.0 \mu\text{m}$). Mobile phase: phosphate buffer (pH 5.5): methanol (45:55), flow rate 1.0 mL/min. UV detection ($\lambda = 235$ nm). Limit of quantification, 0.05 mg/L, limit of detection, 0.01 mg/L [Kaul *et al.* 2005].

Ultraviolet Spectrum Aqueous acid (pH 2.38)—196, 226, 316 nm.

Mass Spectrum Principal ions at m/z 253, 218, 196, 255, 42, 198, 43, 224.

Quantification

Blood GC-MS Column: RTX-200 ($30 \text{ m} \times 0.25$ mm i.d., $0.25 \mu\text{m}$). Carrier gas: He, 1.0 mL/min. Temperature programme: 70° for 1 min to 290° at $20^{\circ}/\text{min}$ for 1 min. MSD, SIM acquisition mode. Limit of quantification, 0.01 mg/L [Sklerov *et al.* 2006].

Plasma GC-MS Column: Ultra-1 SE-30 ($17 \text{ m} \times 0.20$ mm i.d., $0.33 \mu\text{m}$). Carrier gas: He, 100 kPa. Temperature programme: 210° for 1 min to 230° at $3^{\circ}/\text{min}$ to 300° at $15^{\circ}/\text{min}$. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, $0.5 \mu\text{g/L}$ [Lee *et al.* 2002].

LC-MS Column: Waters Symmetry C_8 (150×4.6 mm i.d., $5 \mu\text{m}$). Mobile phase: 2 mmol/L ammonium formate (pH 2.8): acetonitrile (10:90), flow rate 1.0 mL/min. API, TIS, positive ion mode. Retention time: 1.49 min. Limit of quantification, 50 ng/L [Nirogi *et al.* 2006]. Column: XTerra RP C_{18} (100×3.9 mm i.d.). Mobile phase: 10 mmol/L ammonium acetate (pH 9.5): acetonitrile. APCI, positive ion mode. Limit of quantification, $0.02 \mu\text{g/L}$ [Granfors *et al.* 2004].

Urine GC-MS See Blood [Sklerov *et al.* 2006].

Bile GC-MS See Blood [Sklerov *et al.* 2006].

Gastric Contents GC-MS See Blood [Sklerov *et al.* 2006].

Liver GC-MS See Blood [Sklerov *et al.* 2006].

Disposition in the Body Tizanidine is rapidly absorbed from the gastrointestinal tract, with 53 to 66% of the dose being absorbed. Peak plasma

concentrations are reached within 1 to 2 h after oral administration. The drug is widely distributed throughout the body and undergoes rapid and extensive first-pass metabolism in the liver ($\sim 95\%$ of a dose). Metabolism is via oxidation of the imidazole moiety, the aromatic system and the sulfur atom. Metabolism is mainly via CYP1A2 [Granfors *et al.* 2004]. Approximately 70% of the dose is excreted in urine as the inactive metabolite, and 20% is excreted in faeces. Renal excretion of the parent compound is approximately 53% after a single 5 mg dose. Tizanidine has a short duration of action. Food has no influence on its pharmacokinetics. The drug displays linear pharmacokinetics within the dosage of 1 to 20 mg.

Therapeutic Concentration

Fifteen healthy males, aged between 19 and 27 years (mean 23.5 years), were administered 4 mg tizanidine twice daily for seven consecutive doses. The volunteers fasted for 10 h before the first dose and for 2 h after each subsequent dose. The mean peak plasma concentration was $2.5 \mu\text{g/L}$ observed at 0.9 h [Shellenberger *et al.* 1999].

Toxicity Low order of acute toxicity.

A 57-year-old woman was found unresponsive. Postmortem tizanidine concentrations were as follows:

Specimen	Concentration (mg/L, mg/kg or mg)
Heart blood	2.340
Urine	0.055
Bile	3.370
Gastric contents	10.00
Liver	9.190

[Sklerov *et al.* 2006]

A 46-year-old man with multiple sclerosis fell into coma very shortly after ingesting 100 tablets of 4 mg tizanidine. Respiratory depression occurred but the patient recovered [Physicians Desk Reference 1999].

Half-life 2.1–4.2 h.

Bioavailability 34–40%.

Volume of Distribution Steady state, 2.4 L/kg.

Clearance Reduced by 50% in the elderly, renal impairment and women taking oral contraceptives.

Protein Binding 30%.

Dose The usual initial dose is 2 mg, which may be increased in steps of 2 mg daily over 3 to 4 days, depending on response. The maximum is 36 mg daily and the usual is 24 mg.

Tobramycin

Antibiotic

$C_{18}H_{37}N_5O_9 = 467.5$

CAS—32986-56-4; 49842-07-1 (sulfate: xH_2SO_4); 79645-27-5 (sulfate: $5H_2SO_4$)

IUPAC Name (2S,3R,4S,5S,6R)-4-Amino-2-[(1S,2S,3R,4S,6R)-4,6-diamino-3-[(2R,3R,5S, 6R)-3-amino-6-(aminomethyl)-5-hydroxyoxan-2-yl]oxy-2-hydroxycyclohexyl]oxy-6-(hydroxymethyl)oxane-3,5-diol

Synonyms O-3-Amino-3-deoxy- α -D-glucopyranosyl-(1 \rightarrow 6)-O-[2,6-diamino-2,3,6-trideoxy- α -D-ribo-hexopyranosyl-(1 \rightarrow 4)]-2-deoxy-D-streptamine; nebramycin factor 6.

Proprietary Names AkTob; Brulamycin; Defy; Distobram; Gernebcin; Mytobrin; Nebcin(a); Nebcine; Obracin; Tob; Tobra(l); Tobra-cell; Tobracil; Tobradistin; Tobralax; Tobramaxin; Tobramina; Tobrasix; Tobrex; Tobridavi; Tomycin(e); Trazil.

Chemical Properties A white hygroscopic powder. A solution in water is dextro-rotatory. Soluble 1 in 1.5 of water and 1 in 2000 of ethanol; practically insoluble in chloroform and ether. pK_a 6.7, 8.3, 9.9. Log P (octanol/water), -5.8 .

Thin-layer Chromatography System TAE— R_f 0.00.

High Performance Liquid Chromatography System HAA—retention time 13.4 min.

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1040, 1590, 845, 770, 660, 1260 cm^{-1} (KBr disk).

Quantification See also under Amikacin.

Serum HPLC For a method for the quantification of tobramycin and other aminoglycosides, see Essers [1984]. UV detection. Limit of detection, 500 $\mu\text{g/L}$ [Barends *et al.* 1981]. Fluorescence detection. Limit of detection, 200 $\mu\text{g/L}$ [Haughey *et al.* 1980].

Urine HPLC See Serum [Haughey *et al.* 1980].

Disposition in the Body Tobramycin is poorly absorbed after oral administration, but rapidly absorbed after IM injection. Up to 90% of a dose is excreted unchanged in the urine in 24 h, most being excreted within the first 6 h. It accumulates in the tissues and may be detected in serum and urine for several days after cessation of treatment.

Therapeutic Concentration During treatment, the serum concentration should be in the range 4 to 10 mg/L and should be monitored regularly, especially in patients who have renal insufficiency. During multiple dosing the trough concentration immediately preceding a dose should not exceed 2 mg/L.

After an IV infusion of 100 mg administered over 1 h to 4 subjects, peak serum concentrations of 4.1 to 5.1 (mean, 4.6) mg/L were achieved at the end of the infusion. After a single IM injection of 100 mg administered to 3 subjects, a mean peak serum concentration of 5.16 mg/L was achieved after 0.3 to 0.75 h [Regamey *et al.* 1973].

Cystic fibrosis patients inhaling 300 mg tobramycin twice daily as an aerosol, in 28-day on/off treatment cycles, had a mean serum concentration of 0.95 mg/L 1 hour after the dose. The mean peak sputum concentration of tobramycin was 1.237 mg/g [Geller *et al.* 2002].

Toxicity Toxic effects may be produced at serum concentrations of 12 mg/L or more or, during chronic treatment, if the trough serum concentration exceeds 2 mg/L.

Half-life Plasma half-life, about 2 to 3 h, increased in renal failure; a long terminal elimination phase of about 6 days has also been reported.

Volume of Distribution About 0.3 L/kg.

Clearance Plasma clearance, about 1.5 mL/min/kg.

Protein Binding Up to 10%.

Dose Usually the equivalent of 3 to 5 mg/kg of tobramycin daily, given parenterally.

Tocainide

Antiarrhythmic

$\text{C}_{11}\text{H}_{16}\text{N}_2\text{O} = 192.3$

CAS—41708-72-9

IUPAC Name 2-Amino-N-(2,6-dimethylphenyl)propanamide

Chemical Properties A white waxy solid. Mp 53° to 55°. Sparingly soluble in water; freely soluble in organic solvents. pK_a 7.8. Log *P* (octanol/water), 0.8. Extraction yield (chlorobutane), 0.3 [Demme *et al.* 2005].

Tocainide Hydrochloride

$\text{C}_{11}\text{H}_{16}\text{N}_2\text{O}\cdot\text{HCl} = 228.7$

CAS—71395-14-7 ((±)-form); 53984-74-0 (R-(-)-form); 53984-76-2 (S-(+)-form)

Proprietary Names *Tonocard*; *Xylotocan*.

Chemical Properties A white crystalline powder. Mp about 245°, with decomposition. Freely soluble in water and ethanol; practically insoluble in chloroform and ether.

Thin-layer Chromatography System TA— R_f 0.60; system TB— R_f 0.02; system TC— R_f 0.23; system TE— R_f 0.44; system TAE— R_f 0.42; system TAF— R_f 0.74.

Gas Chromatography System GA—RI 1714; system GB—RI 1769.

High Performance Liquid Chromatography System HA—*k* 1.2; system HX—RI 247; system HY—RI 208; system HZ—retention time 2.1 min.

Ultraviolet Spectrum Aqueous acid—262 ($A_1^1=22a$), 270 nm ($A_1^1=18b$).

Infrared Spectrum Principal peaks at wavenumbers 1675, 1540, 765, 1128, 772, 1240 cm^{-1} (tocainide hydrochloride, KBr disk).

Mass Spectrum Principal ions at *m/z* 44, 121, 77, 120, 42, 106, 91, 39.

Quantification

Plasma GC ECD. Limit of detection, 2 pg [Pillai *et al.* 1982]. FID. Limit of detection, 200 $\mu\text{g/L}$ [Gettings *et al.* 1981].

HPLC Fluorescence detection. Limit of detection, 250 $\mu\text{g/L}$ [Carr *et al.* 1991]. Fluorescence or UV detection. For a method of quantification for tocainide and other anti-arrhythmics, see Verbesselt *et al.* [1991]. Serum GC FID. Limit of detection, 200 $\mu\text{g/L}$ [Gettings *et al.* 1981].

HPLC See Plasma [Annesley *et al.* 1986]; [vasBinder, Annesley 1991]. Limit of detection, 100 to 200 $\mu\text{g/L}$ for tocainide and other anti-arrhythmics and metabolites [Proelss, Townsend 1986].

Urine GC See Plasma [Pillai *et al.* 1982].

Disposition in the Body Tocainide is almost completely absorbed after oral administration. About 20 to 50% of a dose is excreted in the urine as unchanged drug in 24 h, and about 20 to 30% as a glucuronide conjugate, which is thought to be

tocainide carbamoyl O- β -D-glucuronide (TOCG); an additional metabolite, lactoxylidide has also been detected in urine.

Therapeutic Concentration In plasma, usually in the range 4 to 12 mg/L.

Following a single oral dose of 400 mg to 3 subjects, peak plasma concentrations of 1.6 to 1.8 mg/L were attained in 0.5 to 2 h. After oral administration of 400 mg three times a day to 4 subjects, steady-state plasma concentrations of 4.9 to 7.1 (mean, 5.9) mg/L were reported. [Graffner *et al.* 1980].

Toxicity

A 26-year-old woman who committed suicide by ingesting a large amount of tocainide was found to have a serum concentration of 68 mg/L. [Sperry *et al.* 1987].

Half-life Plasma half-life, 8 to 25 (mean, 14) h.

Volume of Distribution About 1 to 3 L/kg.

Clearance Plasma clearance, about 2 to 3 mL/min/kg.

Protein Binding Various reported as 10 to 50%.

Note For a review of tocainide, see Holmes *et al.* [1983].

Dose 1.2 to 2.4 g of tocainide hydrochloride daily, orally.

Tofenacin

Antidepressant

C₁₇H₂₁NO = 255.4

CAS—15301-93-6

IUPAC Name N-Methyl-2-[(2-methylphenyl)phenylmethoxy]ethanamine

Synonyms N-Demethylorphenadrine; desmethylorphenadrine.

Chemical Properties A liquid. Log *P* (octanol/water), 3.4.

Tofenacin Hydrochloride

C₁₇H₂₁NO₂·HCl = 291.8

CAS—10488-36-5

Synonym BS-7331

Proprietary Names Elamol; Tofacine.

Chemical Properties A white to off-white crystalline powder. Mp 147° to 148°. Soluble 1 in about 3 of water, 1 in 8 of ethanol and 1 in 3 of chloroform; slightly soluble in acetone; practically insoluble in ether.

Colour Tests Liebermann's reagent—red-orange; Mandelin's test—yellow; Marquis test—yellow; sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.45; system TB—R_f 0.26; system TC—R_f 0.21; system TE—R_f 0.48; system TL—R_f 0.07; system TAE—R_f 0.14 (acidified potassium permanganate solution, positive).

Gas Chromatography System GA—RI 1920; system GB—RI 2013; system GM—RRT 0.420 (relative to iprindole).

High Performance Liquid Chromatography System HA—*k* 1.7; system HZ—retention time 5.3 min.

Ultraviolet Spectrum Ethanol—259, 265, 272 nm.

Infrared Spectrum Principal peaks at wavenumbers 1102, 704, 757, 1117, 1042, 917 cm⁻¹ (tofenacin hydrochloride, KBr disk).

Mass Spectrum Principal ions at *m/z* 44, 59, 165, 166, 181, 179, 178, 43.

Quantification See under Orphenadrine.

Disposition in the Body Tofenacin is a metabolite of orphenadrine.

Dose Up to 240 mg of tofenacin hydrochloride daily.

Tolazamide

Antidiabetic

C₁₄H₂₁N₃O₃S = 311.4

CAS—1156-19-0

IUPAC Name 1-(Azepan-1-yl)-3-(4-methylphenyl)sulfonylurea

Synonym N-[[Hexahydro-1H-azepin-1-yl]amino]carbonyl]-4-methylbenzenesulfonamide

Proprietary Names Diabewas; Norglycin; Tolanas; Tolinas.

Chemical Properties A white crystalline powder. Mp 170° to 173°. Very slightly soluble in water; slightly soluble in ethanol; soluble in acetone; freely soluble in chloroform. pK_a 3.5 (25°), 5.7 (37.5°). Log *P* (octanol/water), 2.7.

Thin-layer Chromatography System TAD—R_f 0.66; system TAE—R_f 0.86; system TB—R_f 0.00; system TD—R_f 0.52; system TE—R_f 0.07; system TF—R_f 0.50; system TAJ—R_f 0.65; system TAK—R_f 0.71; system TAL—R_f 0.95 (acidified potassium permanganate solution, positive).

Gas Chromatography System GA—RI 1651.

High Performance Liquid Chromatography System HX—RI 452; system HY—RI 445; system HZ—retention time 6.8 min.

Ultraviolet Spectrum Methanol—257, 263 (A₁—21a), 268, 275 nm.

Infrared Spectrum Principal peaks at wavenumbers 1694, 1176, 884, 819, 675, 1086 cm^{-1} (KBr disk). Polymorphism may occur.

Mass Spectrum Principal ions at m/z 91, 155, 114, 65, 197, 42, 41, 85.

Quantification

Serum HPLC UV detection. Limit of detection, 1 mg/L [Welling *et al.* 1982].

Urine Micellar electrokinetic chromatography Limit of detection, 50 $\mu\text{g/L}$ for tolazamide and other hypoglycaemic drugs [Núñez *et al.* 1995].

Disposition in the Body Tolazamide is slowly absorbed after oral administration. About 85% of a dose is excreted in the urine in 5 days, mostly in the first 24 h. Of the urinary material, about 17% is the *p*-carboxy derivative, 25% is 4-hydroxytolazamide, 10% is *p*-hydroxymethyltolazamide, 26% is *p*-toluenesulfonamide and 7% is unchanged drug.

Therapeutic Concentration

Following a single oral dose of 500 mg to 20 subjects, a mean peak serum concentration of 27.8 mg/L was attained in 3 h [Welling *et al.* 1982].

Half-life Plasma half-life, about 5 h.

Protein Binding About 94%.

Note For a review of the pharmacokinetics of sulfonylurea hypoglycaemic drugs, see Jackson and Bressler [1981].

Dose 0.1 to 1 g daily.

Tolazoline

Vasodilator

$\text{C}_{10}\text{H}_{12}\text{N}_2 = 160.2$

CAS—59-98-3

IUPAC Name 2-Benzyl-4,5-dihydro-1H-imidazole

Synonyms Benzazoline; 4,5-dihydro-2-(phenylmethyl)-1H-imidazole.

Chemical Properties Soluble in water and chloroform. pK_a 10.6 (20°). Log *P* (octanol/water), 2.7.

Tolazoline Hydrochloride

$\text{C}_{10}\text{H}_{12}\text{N}_2\cdot\text{HCl} = 196.7$

CAS—59-97-2

Proprietary Names *Prisolol*; *Priscoline*; *Vaso-Dilatan*.

Chemical Properties A white or creamy-white crystalline powder. Mp 174°. Soluble 1 in 0.5 of water, 1 in 2 of ethanol and 1 in 3 of chloroform; practically insoluble in ether.

Colour Tests Aromaticity (method 2)—colourless/orange; Liebermann's reagent—orange.

Thin-layer Chromatography System TA— R_f 0.13; system TB— R_f 0.02; system TC— R_f 0.02; system TE— R_f 0.25; system TL— R_f 0.02; system TAE— R_f 0.03; system TAF— R_f 0.55 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 1598.

High Performance Liquid Chromatography System HA— k 2.1; system HX—RI 225; system HY—RI 179.

Ultraviolet Spectrum Aqueous acid—257 ($A_1^1=14.7a$), 263 nm.

Infrared Spectrum Principal peaks at wavenumbers 1608, 1296, 721, 1580, 690, 775 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 91, 159, 160, 131, 65, 92, 81, 39.

Quantification

Plasma HPLC UV detection. Limit of detection, 200 $\mu\text{g/L}$ [Rovei *et al.* 1982].

Serum HPLC UV detection. Limit of detection, 50 to 250 $\mu\text{g/L}$ [Todesco *et al.* 1987]. UV detection. Limit of detection, 100 $\mu\text{g/L}$ [Cwik *et al.* 1985].

Capillary isotachopheresis Limit of detection, 40 mg/L [Hercegoва *et al.* 1998].

Urine HPLC See Serum [Cwik *et al.* 1985].

Capillary isotachopheresis Limit of detection, 3 mg/L [Hercegoва *et al.* 1998].

Disposition in the Body Tolazoline is well absorbed after oral or parenteral administration. It is excreted in the urine, about 90% of an oral dose being eliminated unchanged in 12 h.

Therapeutic Concentration

After a bolus intravenous injection of 2 mg/kg followed by continuous IV infusion to provide a maintenance dose of 2 mg/kg to 1 neonate, plasma

T

concentrations attained a steady-state of 7 to 8 mg/L and declined with a half-life of 5 h at the end of the infusion [Rovei *et al.* 1982].

Toxicity

A 54-year-old woman found comatose after ingesting 2.5 g of tolazoline hydrochloride died about 3 h later. Postmortem concentrations were: femoral blood 130 mg/L, liver 102 µg/g [Turner LK, personal communication, 1964].

Dose 12.5 to 200 mg of tolazoline hydrochloride daily.

Cwik MJ *et al.* (1985). Quantitative determination of tolazoline in serum and urine. *J Chromatogr* 338: 123–130.

Tolbutamide

Antidiabetic

$C_{12}H_{18}N_2O_3S = 270.3$

CAS—64-77-7

IUPAC Name 1-Butyl-3-(4-methylphenyl)sulfonylurea

Synonyms Butamidum; N-[(butylamino)carbonyl]-4-methylbenzenesulfonamide; toglybutamide.

Proprietary Names Arcosol; Artosin; Diabetil; Diatelan; Diatol; Diaval; Dolipol; Flusan; Glyconon; Ifumelus; Ipoglusan; Mobenol; Novobutamide; Orabet; Orinase; Orsinon; Rastinon (tablets); Tol-Tab.

Chemical Properties A white crystalline powder. Mp about 129°. Practically insoluble in water; soluble 1 in 10 of ethanol and 1 in 3 of acetone; soluble in chloroform; slightly soluble in ether. pK_a 5.3 (20°). Log *P* (octanol/water), 2.3.

Tolbutamide Sodium

$C_{12}H_{17}N_2NaO_3S = 292.3$

CAS—473-41-6

Proprietary Names Orinase Diagnostic; Rastinon (injection).

Chemical Properties A white crystalline powder. Mp 130° to 133°. Freely soluble in water; soluble in ethanol and chloroform; very slightly soluble in ether.

Colour Tests Koppányi–Zwicker test—violet; mercurous nitrate—black.

Thin-layer Chromatography System TA— R_f 0.76; system TD— R_f 0.51; system TE— R_f 0.12; system TF— R_f 0.55; system TT— R_f 0.98; system TU— R_f 0.35; system TV— R_f 0.04; system TAD— R_f 0.62; system TAE— R_f 0.88; system TAF— R_f 0.88; system TAJ— R_f 0.69; system TAK— R_f 0.74; system TAL— R_f 0.93.

Gas Chromatography System GA—RI 1683.

High Performance Liquid Chromatography System HX—RI 477; system HY—RI 424; system HZ—retention time 5.9 min.

Ultraviolet Spectrum Methanol—257, 263 ($A_1^1=22a$), 268, 275 nm.

Infrared Spectrum Principal peaks at wavenumbers 1658, 1157, 1552, 668, 1090, 905 cm^{-1} (KBr disk). Polymorphism may occur.

Mass Spectrum Principal ions at m/z 91, 30, 155, 108, 65, 197, 39, 107.

Quantification See also under Chlorpropamide.

Plasma GC ECD. Limit of detection, 1 mg/L for tolbutamide and two metabolites [Matin, Rowland 1973].

HPLC UV detection. Limit of detection, 0.1 to 1.5 µM for tolbutamide and metabolites [Hansen, Brosen 1999]. Photodiode-array detection. For a method for the quantification of tolbutamide and metabolites, see Csillag *et al.* [1989]. **UV detection.** Limit of detection, 2 mg/L for tolbutamide, 100 µg/L for the carboxy metabolite [Raghow, Meyer 1981]. **UV detection.** Limit of detection, 200 µg/L [Hill, Chamberlain 1978].

Serum MS Limit of detection, 2 µg/L, limit of quantification, 10 µg/L for tolbutamide and other sulfonylureas [Magni *et al.* 2000].

Urine GC See Plasma [Matin, Rowland 1973].

HPLC See Plasma. Limit of detection, 0.5 to 2 µmol/L for tolbutamide and metabolites [Hansen, Brosen 1999]. See Plasma [Csillag *et al.* 1989].

Disposition in the Body Tolbutamide is readily absorbed after oral administration. About 85% of an oral dose is excreted in the urine in 48 h, of which about two-thirds is the 4-carboxy metabolite and about one-third is the 4-hydroxymethyl metabolite; <5% is excreted as unchanged drug. About 9% of a dose is eliminated in the faeces in 48 h.

Therapeutic Concentration

Following a single oral dose of 500 mg to 1 subject, a peak plasma-tolbutamide concentration of 49 mg/L was attained in about 4 h and a peak plasma concentration of the 4-carboxy metabolite of about 2.2 mg/L was attained in 6 h [Raghow, Meyer 1981].

In 20 patients treated for non-insulin-dependent diabetes mellitus with tolbutamide (average daily dose, 2 g), the plasma concentration was 19.8 (range, 4.3 to 58.2) mg/L before their morning dose and a maximum of 92.2 (39.8 to 154.7) mg/L 85 (35 to 370) min after the dose [Ferner *et al.* 1991].

Toxicity Several fatalities from hypoglycaemia have been reported.

The following postmortem tissue distribution was reported in one suicide after the ingestion of 50 g: blood 640 mg/L, kidney 1073 µg/g, liver 930 µg/g, urine 3510 mg/L [Pribilla 1968].

Half-life Plasma half-life, usually in the range 4 to 12 (mean, 7) h but may vary up to 70 h during concomitant administration of other drugs such as sulfonamides, phenylbutazone, or dicoumarol.

Volume of Distribution 0.1 to 0.2 L/kg.

Clearance Plasma clearance, about 0.3 mL/min/kg.

Protein Binding About 95% at concentrations up to 100 µg/mL, decreasing to about 90% at plasma concentrations of 200 µg/mL.

Note For a review of sulfonylurea hypoglycaemic drugs, see Jackson and Bressler [1981].

Dose 0.25 to 3 g daily.

Csillag K *et al.* (1989). Simple high-performance liquid chromatographic method for the determination of tolbutamide and its metabolites in human plasma and urine using photodiode-array detection. *J Chromatogr* 490: 355–363.

Tolfenamic Acid

Analgesic

$C_{14}H_{12}ClNO_2 = 261.7$

CAS—13710-19-5

IUPAC Name 2-(3-Chloro-2-methylanilino)benzoic acid

Synonym 2-[(3-Chloro-2-methylphenyl)amino]benzoic acid

Proprietary Names *Bifenac; Clotam; Clotan; Flocur; Migea; Rociclyn.*

Chemical Properties A white crystalline powder. Mp about 207°. Practically insoluble in water; soluble 1 in 70 of ethanol, 1 in 140 of chloroform, 1 in 15 of dimethylformamide and 1 in 45 of ether. Log *P* (octanol/water) 5.2.

Thin-layer Chromatography System TE—*R_f* 0.14; system TF—*R_f* 0.31.

Gas Chromatography System GL—Tolfenamic acid-ME RI 2255.

High Performance Liquid Chromatography System HX—RI 690; system HZ—retention time 37.9 min.

Ultraviolet Spectrum Dehydrated alcohol—294, 330 nm.

Infrared Spectrum Principal peaks at wavenumbers 1670, 1270, 1590, 755, 1500, 1575 cm^{-1} (KBr disk).

Quantification

Plasma HPLC UV detection. Limit of detection, 20 $\mu g/L$ [Pentikäinen *et al.* 1981].

Urine HPLC UV detection. Limit of detection, about 2 ng for tolfenamic acid and other anthranilic acid derivatives [Mikami *et al.* 2000]. See Plasma [Pentikäinen *et al.* 1981].

Disposition in the Body Readily absorbed after oral administration. It is metabolised by hydroxylation to *N*-[(2-hydroxymethyl-3-chlorophenyl)amino]benzoic acid and *N*-[(2-methyl-3-chloro-4-hydroxyphenyl)-amino]benzoic acid, which are the major metabolites. About 50% of an oral dose is excreted in the urine in 48 h mainly as glucuronide conjugates of the two hydroxylated metabolites. Less than 10% of a dose is excreted in the urine as unchanged drug or its glucuronide conjugate. Tolfenamic acid and its metabolites are excreted in the bile.

Therapeutic Concentration

Following single oral doses of 100 and 200 mg to 6 subjects, mean peak plasma concentrations of 2.0 and 3.0 mg/L were attained in 1.3 and 1.5 h respectively [Pentikäinen *et al.* 1981].

Bioavailability About 60%.

Half-life Plasma half-life, about 2.5 h.

Volume of Distribution About 0.5 L/kg.

Clearance Plasma clearance about 2.5 mL/min/kg.

Protein Binding >99.5%.

Dose Tolfenamic acid has been given in doses of 300 to 600 mg daily.

Mikami E *et al.* (2000). Simultaneous analysis of anthranilic acid derivatives in pharmaceuticals and human urine by high-performance liquid chromatography with isocratic elution. *J Chromatogr B Biomed Sci Appl* 744: 81–89.

Pentikäinen PJ *et al.* (1981). Human pharmacokinetics of tolfenamic acid, a new anti-inflammatory agent. *Eur J Clin Pharmacol* 19: 359–365.

Tolmetin

Analgesic

$C_{15}H_{15}NO_3 = 257.3$

CAS—26171-23-3

IUPAC Name 2-[1-Methyl-5-(4-methylbenzoyl)pyrrol-2-yl]acetic acid

Synonym 1-Methyl-5-(4-methylbenzoyl)-1*H*-pyrrole-2-acetic acid

Chemical Properties Crystals. Mp 155° to 157°, with decomposition. *pK_a* 3.5. Log *P* (octanol/water) 2.8.

Tolmetin Sodium

$C_{15}H_{14}NNaO_3 \cdot 2H_2O = 315.3$

CAS—35711-34-3 (anhydrous); 64490-92-2 (dihydrate)

Proprietary Names *Artrocaptin; Tolectin.*

Colour Tests Formaldehyde-Sulfuric acid—brown-red; Liebermann's reagent (100°)—red.

Thin-layer Chromatography System TD—*R_f* 0.13; system TE—*R_f* 0.05; system TF—*R_f* 0.20; system TG—*R_f* 0.10; system TAD—*R_f* 0.30; system TAE—*R_f* 0.85; system TAJ—*R_f* 0.20; system TAK—*R_f* 0.59; system TAL—*R_f* 0.83 (Ludy Tenger reagent, black).

Gas Chromatography System GA—RI 1890; tolmetin-ME RI 2247; System GD—methyl derivative RRT 1.77, relative to *n*- $C_{16}H_{34}$; system GL—tolmetin-ME RI 2235; M (COOH-)-ME₂ RI 2600.

High Performance Liquid Chromatography System HD—*k* 2.05; system HV—RRT 0.60 and RRT 0.99 relative to meclofenamic acid; system HX—RI 470; system HY—RI 434; system HZ—retention time 5.4 min.

Ultraviolet Spectrum Aqueous acid—262 nm ($A_1^1=345b$), 315 nm ($A_1^1=735b$); aqueous alkali—260 nm ($A_1^1=333b$), 323 nm ($A_1^1=762b$).

Mass Spectrum Principal ions at *m/z* 212, 213, 122, 198, 44, 53, 91, 65.

Quantification

Plasma GC ECD. Limit of detection, 100 µg/L [Ng 1978].

HPLC UV detection. Range of detection, 0.05 to 50 mg/L for tolmetin, tolmetin glucuronide and isomeric conjugates [Hyneck *et al.* 1987]. UV detection. Limit of detection, 40 µg/L for tolmetin and the dicarboxylated metabolite [Desiraju *et al.* 1982].

Urine HPLC See Plasma. Range of detection, 0.025 to 50 mg/L for tolmetin, tolmetin glucuronide and isomeric conjugates [Hyneck *et al.* 1987]. See Plasma. For a method of quantification for tolmetin and the dicarboxylated metabolite, see Desiraju *et al.* [1982].

Disposition in the Body Rapidly and almost completely absorbed after oral administration. Metabolised mainly by oxidation to inactive metabolites. >90% of a dose is excreted in the urine in 24 h, mostly in the first 8 h. The urinary material consists mostly of free and conjugated (glucuronide) 5-(4-carboxybenzoyl)-1-methylpyrrol-2-ylacetic acid and conjugated (glucuronide) tolmetin; up to 15% is excreted in the urine as unchanged drug.

Therapeutic Concentration

After a single oral dose of 300 mg to 5 subjects, a mean peak plasma concentration of 29.3 mg/L of tolmetin was attained in 0.25 to 1 h; plasma concentrations of the dicarboxylated metabolite reached a peak of about 5 mg/L in 1.5 to 3 h [Selley *et al.* 1975].

Following oral administration of 400 mg four times a day to 5 subjects for 7 days, maximum steady-state plasma concentrations of 8.3 to 78.9 mg/L (mean, 45) of tolmetin and 4.1 to 13.6 mg/L (mean, 10) of the dicarboxylated metabolite were reported about 0.75 and 1.75 h after a dose, respectively [Dromgoole *et al.* 1982].

Toxicity Toxic effects are associated with plasma concentrations greater than about 60 µg/mL.

Half-life Plasma half-life, about 6 h.

Clearance Plasma clearance, about 1 to 2 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, 1.8.

Protein Binding Tolmetin >99% but displaced by salicylic acid; dicarboxylated metabolite about 70%.

Note For a review of the pharmacokinetics of tolmetin, see Brogden *et al.* [1978].

Dose The equivalent of 0.6 to 1.8 g of tolmetin daily.

Brogden RN *et al.* (1978). Tolmetin: a review of its pharmacological properties and therapeutic efficacy in rheumatic diseases. *Drugs* 15: 429–450.

Tolnaftate**Antifungal**

C₁₉H₁₇NOS = 307.4

CAS—2398-96-1

IUPAC Name O-Naphthalen-2-yl N-methyl-N-(3-methylphenyl)carbamothioate

Synonym Methyl(3-methylphenyl)-carbamothioic acid O-2-naphthalenyl ester

Proprietary Names Absorbine Antifungal; Aftate; Blis-To-Sol; Curatin; Devorfungi; Excelsior; Micoisdin; Mycil; Pitrex; Podactin; Quinsana Plus; Sorgoa; Sorgoran; Sporiline; Tinactin; Tinatox; Tineafax; Tinaderm(e); Tinasol; Tolnaderm; Tonoftal; Trinaderm.

Chemical Properties A white to creamy-white powder. Mp about 111°. Practically insoluble in water; sparingly soluble in ethanol and methanol; soluble 1 in 8 of acetone, 1 in 2.5 of chloroform and 1 in 55 of ether. Log P (octanol/water) 5.8.

Colour Tests Mandelin's test—brown; Marquis test—blue-green.

Thin-layer Chromatography System TAJ—R_f 0.96; system TAK—R_f 0.83; system TAL—R_f 0.97.

High Performance Liquid Chromatography System HY—RI 867.

Ultraviolet Spectrum Methanol—257 nm (A₁¹=708a).

Infrared Spectrum Principal peaks at wavenumbers 1211, 1170, 1156, 754, 1234, 810 cm⁻¹ (KBr disk).

Use Topically as a 1% solution, powder or cream.

Tolonium Chloride

Quaternary Ammonium, Phenothiazine, Dye, Antiheparin Compound, Tumour Marker

C₁₅H₁₆N₃S₂Cl = 305.8

IUPAC Name (7-Amino-8-methylphenothiazin-3-ylidene)-dimethylazanium chloride

Synonyms 3-Amino-7-dimethylamino-2-methyl-phenazothionium chloride; Basic Blue 17; colour index number 52040; toluidine blue O.

Proprietary Name *Blutene Chloride*

Chemical Properties Green, crystalline powder with a bronze lustre. Soluble 1 in 20 of water; slightly soluble in ethanol; almost insoluble in ether; very slightly soluble in chloroform. Tolonium chloride has been used as a diagnostic aid for oral [Epstein *et al.* 2007 Gupta *et al.* 2007] and gastric [Hallissey, Fielding 1988] neoplasms and in the identification of the parathyroid gland in thyroid surgery [Archer *et al.* 1972; National Institutes of Health 2008].

Colour Tests Ammonium molybdate test—(blue) green (limit of detection, 0.1 µg); ammonium vanadate test—(blue) purple→green (limit of detection, 0.1 µg); sulfuric acid–formaldehyde test—(blue) green (limit of detection, 0.1 µg); Vitali's test—(blue) blue/blue/dull red (limit of detection, 0.5 µg).

Thin-layer Chromatography System T1—R_f 0.01 (location under ultraviolet light, red fluorescence; location reagent acidified iodoplatinate spray, positive reaction).

Ultraviolet Spectrum 0.1 N sulfuric acid—245 and 285 nm.

Note McKamey and Spitznagle [1975] have analysed the impurities of commercial tolodium chloride and Marshall and Lewis [1974] have looked at batch variations.

Disposition in the Body Tolonium chloride inhibits the anticoagulant effect of heparinoid substances in the blood.

Note For a study of the pharmacokinetics of tolodium chloride in sheep, see Cudd *et al.* [1996].

Therapeutic Concentration A muco-adhesive patch containing 50 or 100 mg tolodium chloride/cm² has been shown to be effective at treating mucocutaneous oropharyngeal candidiasis caused by *Candida albicans* [Donnelly *et al.* 2007].

Toxicity

Note For case studies involving tolodium chloride as an antidote, see Lindenmann *et al.* [2006], Iwersen-Bergmann and Schmoldt [2000] and Ewert *et al.* [1998].

Dose Up to 300 mg daily.

Note During treatment with tolodium chloride the urine of patients assumes a blue-green colour.

Toloxatone

Antidepressant

$C_{11}H_{13}NO_3 = 207.2$

CAS—29218-27-2

IUPAC Name 5-(Hydroxymethyl)-3-*m*-tolyl-2-oxazolidinone

Proprietary Name Humoryl

Chemical Properties White to off-white crystalline powder with M_p 76°. It is slightly soluble in water (4.5 g/L), 0.1 mol/L hydrochloric acid and 0.1 mol/L sodium hydroxide solution. $\log P$ (octanol/water), 1.88.

Thin-layer Chromatography

Plate: silica gel coated plates (Kieselgel 60). Mobile phase: chloroform: diethyl ether: methanol:25% ammonia (85:15:20:0.5). Detection: colour reaction with nitrous gas. R_f 0.68. Limit of detection, 0.005 mg/L. [Benedetti *et al.* 1982].

High Performance Liquid Chromatography System HAA—RT 14.1 min.

Column: Symmetry C_8 (250 × 4.6 mm i.d., 5 μ m). Mobile phase: 50 mmol/L sodium phosphate buffer (pH 3.8): acetonitrile (85:15 for 6.5 min to 65:35 for 18.5 min to 20:80 for 3 min), flow rate 1 mL/min for 6.5 min, to 1.5 mL/min over 18.5 min for 3 min. UV detection ($\lambda = 204$ nm). RT: 14.11 min [Gaillard, Pepin 1997].

Ultraviolet Spectrum Aqueous acid—330 nm.

Quantification

Blood HPLC Column: Nova-Pack C_{18} (300 × 3.9 mm, 4 μ m). Mobile phase: methanol: tetrahydrofuran: 10 mmol/L potassium dihydrogen phosphate (pH 2.6, 65:5:30), flow rate 0.8 mL/min. UV detection ($\lambda = 238$ nm). Retention time: 3.35 min. Limit of detection, <0.12 mg/L [Tracqui *et al.* 1995].

LC-MS Column: XTerra RP18 (100 × 2.1 mm i.d.). Mobile phase: acetonitrile: 4 mmol/L ammonium formate buffer (pH 3.2, 5:95 for 2 min to 20:80 in 1 min to 30:70 over 12 min for 2 min to 5:95 in 30 s for 2.5 min), flow rate 0.15 mL/min. ESI, MRM acquisition mode, positive ion mode. Retention time: min. Limit of quantification, 2 μ g/L [Titier *et al.* 2007].

Plasma GC Column: 3% OV-101 Supelcoport 80/100 mesh (2000 × 2 mm i.d.), silanised glass. Temperature: 200°. Carrier gas: He, 35 mL/min. NPD. Retention time: 2.5 min (TMS derivative) [Vajta *et al.* 1983].

HPLC Column: Hypurity C_{18} (250 × 4.6 mm i.d., 5 μ m). Mobile phase: acetonitrile: phosphate buffer (pH 3.8, 25:75 to 40:60 in 10 min to 44:56 at 8 min), flow rate 1.0 mL/min. UV detection ($\lambda = 240$ nm). Retention time: 9.3 min. Limit of quantification, 25 μ g/L, limit of detection, 10 μ g/L [Duverneuil *et al.* 2003].

Disposition in the Body Toloxatone is rapidly absorbed from the gastrointestinal tract after oral administration. It is rapidly and extensively metabolised and no unchanged drug is found in urine. The major metabolite is 3-(3-carboxyphenyl)-5-hydroxymethyl-2-oxozalidinone produced by methyl-oxidation of the drug. The drug is eliminated extensively in urine (80%), mostly as its metabolites.

Therapeutic Concentration

Five healthy adult volunteers, aged between 23 and 42 years, were administered with a single oral dose of 1-mg/kg 1 h after a standard breakfast. Three weeks later, the volunteers received a 1-mg/kg IV infusion of tolaxatone. The mean peak tolaxatone concentration for the oral dose was 0.474 (range, 0.384–0.640) mg/L at 0.83 h (0.53–1.00 h). The drug concentration after the IV dose was 0.623–0.840 mg/L observed at the end of the 30 min infusion [Benedetti *et al.* 1982].

Toxicity The minimum toxic dose reported in cases of tolaxatone poisoning is 2 g. The first symptoms, including drowsiness and mild adrenergic effects, are observed after 1 h. In cases of massive overdose, coma and jerks have occurred. In cases where tolaxatone was co-administered with tricyclic antidepressants, 2 patients died and symptoms included muscular rigidity, hyperthermia and cardiovascular collapse [Azoyan *et al.* 1990].

Half-life 0.88–2.46 h.

Bioavailability 50–62%.

Volume of Distribution 1.09–1.64 L/kg.

Clearance Plasma, 0.462–0.860 L/h/kg.

Protein Binding 49–53% (mainly to albumin).

Dose Orally, 200 mg three times a day.

Tolpropamine

Antihistamine

$C_{18}H_{23}N = 253.4$

CAS—5632-44-0

IUPAC Name *N,N*-Dimethyl-3-(4-methylphenyl)-3-phenylpropan-1-amine

Synonym *N,N,N*,4-Trimethyl- γ -phenylbenzenepropanamine

Chemical Properties Practically insoluble in water; soluble in chloroform. $\log P$ (octanol/water) 4.4.

Tolpropamine Hydrochloride

$C_{18}H_{23}N, HCl = 289.8$

CAS—3339-11-5

Proprietary Name Pragman

Chemical Properties A white crystalline powder. M_p 182° to 184°. Soluble in water and ethanol; practically insoluble in chloroform and ether.

Colour Tests Mandelin's test—brown; Marquis test—red.

Thin-layer Chromatography System TA— R_f 0.51; system TB— R_f 0.52; system TC— R_f 0.32; system TE— R_f 0.68; system TL— R_f 0.15; system TAE— R_f 0.26 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—tolpropamine RI 1900; M (OH-) RI 2150; M (nor-) RI 2100; M (nor-OH-) RI 2200; M (*N*-oxide-) RI 1750.

High Performance Liquid Chromatography System HA— k 2.9.

Ultraviolet Spectrum Aqueous acid—260 nm ($A_1^1=25a$), 265 nm ($A_1^1=25a$), 273 nm.

Infrared Spectrum Principal peaks at wavenumbers 727, 776, 700, 802, 1515, 970 cm^{-1} (tolpropamine hydrochloride, KBr disk).

Use Topically in a concentration of 1% of the hydrochloride.

Tolrestat

Antidiabetic

$\text{C}_{16}\text{H}_{14}\text{F}_3\text{NO}_3\text{S}$ = 357.3

CAS—82964-04-3

IUPAC Name 2-[[6-Methoxy-5-(trifluoromethyl)naphthalene-1-carbonyl]-methylamino]acetic acid

Synonyms AY-27773; *N*-[[6-methoxy-5-(trifluoromethyl)-1-naphthalenyl]thioxomethyl]-*N*-methylglycine.

Proprietary Names Alredase; Lorestat.

Chemical Properties Mp 164° to 165°.

Mass Spectrum Principal ions at *m/z* 357, 269, 226, 356, 207, 312, 279, 324.

Quantification

Serum HPLC Column: ODS Hypersil (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: 100 mmol/L phosphate buffer (pH 6.0, 30:70), flow rate 1.1 mL/min. UV detection (λ =240 nm). Retention time: 6.4 min. Limit of detection, 25 $\mu\text{g/L}$ (2 mL serum), 200 $\mu\text{g/L}$ (1 mL serum) [Hicks, Kraml 1984].

Tissue HPLC See Serum. Limit of detection, 50 ng/g [Hicks, Kraml 1984].

Disposition in the Body Tolrestat is well absorbed within 2 h and rapidly distributed throughout the body. Elimination is renal (63 to 68%) and faecal (25 to 27%) mainly as the unchanged drug, along with conjugated tolrestat and sulfo-tolrestat as minor metabolites. No accumulation was observed after multiple dosing. The majority of the dose (~95%) is excreted within 7 days of administration.

Therapeutic Concentration

Twenty healthy, young females (mean age, 25 years) and males (mean age, 31 years), were administered with a single 200 mg dose of tolrestat after an overnight fast, and were fasted for an additional 4 h after dosing. Multiple dosing of 200 mg every 12 h for 5 days was administered. 25 healthy, elderly males (mean age, 74 years), and females (mean age, 73 years), were also included in the study. Mean peak plasma concentrations were 27 (19 to 34), 21 (12 to 30) mg/L, observed at mean times 1.2 (0.6 to 1.8), 1.3 (0.5 to 2.1) h, for the females and males, respectively [Fruncillo *et al.* 1996].

Bioavailability Linearly proportional to dose over 25 to 800 mg.

Half-life 10 to 13 h.

Volume of Distribution 0.27 to 0.41 L/kg.

Clearance Oral clearance, 18 to 30 mL/h/kg.

Protein Binding 99%.

Dose 200 mg.

Fruncillo R *et al.* (1996). Pharmacokinetics of the aldose reductase inhibitor tolrestat: studies in healthy young and elderly male and female subjects and in subjects with diabetes. *Clin Pharmacol Ther* 59(6): 603–612.

Tolterodine

Antimuscarinic

$\text{C}_{22}\text{H}_{31}\text{NO}$ = 325.5

CAS—124937-51-5

IUPAC Name 2-[(1*R*)-3-[Di(propan-2-yl)amino]-1-phenylpropyl]-4-methylphenol

Synonym 2-[(1*R*)-3-[Bis(1-methylethyl)amino]-1-phenylpropyl]-4-methylphenol

Proprietary Names Detrol; Difluorasone Topical.

Chemical Properties pK_a 9.9.

Tolterodine Tartrate

$\text{C}_{22}\text{H}_{31}\text{NO}_4$ = 475.6

Proprietary Names Detrol; Detrusitol.

Chemical Properties A white crystalline powder. Soluble in water (12 g/L at room temperature); soluble in methanol; slightly soluble in ethanol; practically insoluble in toluene.

High Performance Liquid Chromatography Column: PKB 100 Supelco (150 × 4.5 mm i.d.). Mobile phase: methanol:20 mmol/L ammonium acetate (pH 4.5, 10:90 to 20:80 in 5 min, to 45:55 in 30 min, to 100:0 in 5 min, for 10 min), flow rate 1 mL/min. UV detection (λ =280 nm). RT: 29 min [Andersson *et al.* 1998].

Mass Spectrum Principal ions at *m/z* 114, 382, 73, 397, 116, 30, 72, 135 (TMS derivative).

Quantification

Plasma GC–MS Column: fused silica capillary with 5% phenyl methyl silicon (25 m × 0.2 mm i.d., 0.33 μm). Temperature: 120° for 0.5 min, to 300° at 35°/min for 5–10 min. Carrier gas: He. IS: [$^2\text{H}_5$] tolterodine. EI ionisation, SIM acquisition mode at *m/z* 382 for tolterodine and 387 for IS. Retention time: tolterodine, (plasma) 7.45 min, (urine) 8.25 min; IS, (plasma) 7.41 min, (urine) 8.22 min. Limit of quantification, 0.5 $\mu\text{g/L}$ [Palmer *et al.* 1997].

Serum GC–MS See Plasma [Palmer *et al.* 1997].

Urine GC–MS See Plasma [Palmer *et al.* 1997].

Disposition in the Body Tolterodine is rapidly absorbed, and levels increase when co-administered with food. Peak plasma concentrations are reached within 1–3 h following an oral dose. Metabolism is mainly by the cytochrome P450 isoenzyme, CYP2D6 to the active 5-hydroxymethyl derivative. In a minority of people with no functional gene of CYP2D6, it is metabolised by CYP3A4 to the inactive *N*-dealkylated derivative. Tolterodine is excreted primarily in urine (77%) with ~17% appearing in faeces. <1% of a dose is excreted as the unchanged drug, and 4% as its metabolites. The half-life is prolonged in poor metabolisers and results in a 7-fold increase in the concentration of tolterodine. Steady state concentrations are achieved within 2 days. Pharmacokinetics are effected by hepatic impairment.

Therapeutic Concentration

Nineteen healthy male and female volunteers with a mean age of 33 years (range, 18–55 years), were classified as being either a poor metaboliser of tolterodine (i.e. no functional gene of CYP2D6) or extensive metabolisers. They were then administered with 4 mg once daily of extended release formulation of tolterodine or 2 mg instant release twice daily, for 6 days. A washout period of 7 days was allowed between the doses. The peak plasma tolterodine concentrations for the extended release dose were 6.1 (1.1–59.0) nmol/L at 4 (2–6) h for the extensive metabolisers and 35

(28–130) nmol/L at 4 (3–6) h for the poor metabolisers. After the instant release formulation, concentrations observed for the extensive metabolisers were 12.0 (1.2–57.0) nmol/L after the morning dose and 9.2 (1.5–50.0) nmol/L after the evening dose. For the poor metabolisers, 51 (40–143) nmol/L in the morning and 45 (34–99) nmol/L in the evening. After the morning dose, peak concentrations were observed at ≈1 h, and in the evening, between 1.5 and 1.8 h (and up to 3 h). These steady state concentrations were observed on day 6 [Olsson, Szamosi 2001].

Toxicity The highest dose of tolterodine L-tartrate given to human volunteers is 12.8 mg as a single dose. The most severe adverse effects were accommodation disturbances and micturition difficulties. Overdose can potentially result in severe central anticholinergic effects.

Bioavailability 17% in extensive metabolisers; 65% in poor metabolisers.

Half-life 2–3 h in extensive metabolisers; 10 h in poor metabolisers.

Volume of Distribution Mean, 113 L.

Clearance In extensive metabolisers: systemic clearance is 30 L/h, apparent oral clearance is ≈8900 following a single 4 mg dose of the drug, and 6919 mL/min following multiple oral doses of the drug, respectively. Poor metabolisers (deficient of CYP2D6) show reduced clearance of 283 mL/min, and apparent oral clearance of 183 mL/min. Clearance of oral tolterodine, ≈18 mL/min/kg in individuals with liver cirrhosis or 95 mL/min/kg in healthy individuals.

Distribution in Blood Neither tolterodine nor the metabolite distributes significantly to erythrocytes. Blood:serum ratio 0.6 (tolterodine); 0.8 (5-hydroxy metabolite).

Protein Binding 96.3% (tolterodine) 64% (5-hydroxymethyl metabolite), primarily to orosomucoids and α₁-acid glycoprotein.

Dose 2 mg twice daily.

GC and GC-MS See Blood [Kim and Park 2000].

HPLC Fluorescence and UV detection. Limit of detection, 50 mg/L for hippuric acid, 5 µg/L for *o*-cresol [Hansen, Døssing 1982].

Breath GC See Blood [Garriott *et al.* 1981].

Tissues GC and GC-MS See Blood [Bellanca *et al.* 1982].

Disposition in the Body Toluene is absorbed from the gastrointestinal tract, through the skin and mucous membranes, and from the lungs. It has an affinity for lipid-rich tissues from which it is slowly released. About 80% of an inhaled dose is oxidised to benzoic acid which is conjugated with glycine to give hippuric acid and excreted in the urine. Conjugation with glucuronic acid also occurs when large amounts of toluene are absorbed. About 20% of the dose is excreted unchanged in expired air with <0.1% in the urine.

Blood Concentration

Exposure to a concentration of 100 ppm of toluene produced a mean venous-blood concentration of about 0.39 mg/L in 6 healthy subjects at rest and about 1.16 mg/L in 6 subjects during light exercise, after 20 to 30 min. Exposure to 200 ppm for the same time produced a mean blood concentration of about 0.55 mg/L in 4 subjects at rest [Astrand *et al.* 1972].

Toxicity Toluene has about the same acute toxicity as benzene but is a less serious industrial hazard. The maximum permissible atmospheric concentration of toluene is 100 ppm. Exposure to air concentrations of 10 000 to 30 000 ppm may cause unconsciousness within a few minutes. A blood concentration of >10 µg/mL may be lethal, although higher concentrations have been found in habitual abusers.

Seven children aged from 9 to 13 years, with an acute encephalopathy caused by toluene intoxication from glue-sniffing were found to have blood-toluene concentrations of 0.8 to 7.7 µg/g (mean, 2.3) [King *et al.* 1981].

A boy of 13 years found dead after sniffing glue had the following postmortem concentrations of toluene in body tissues: blood 11 mg/L, brain 44 µg/g, kidney 39 µg/g, liver 47 µg/g [Collom, Winek 1970].

The following postmortem tissue concentrations of toluene were reported in a 16-year-old boy found dead with a plastic bag over his head: blood 20.6 mg/L, brain 297 µg/g, liver 89 µg/g; acetone was also detected in blood at a concentration of 3 mg/L [Paterson, Sarvesvaran 1983].

Half-life Blood half-life about 7.5 h.

Tolycaine

Anaesthetic (Local)

C₁₅H₂₂N₂O₃ = 278.4

CAS—3686-58-6

IUPAC Name Methyl 2-[(2-diethylaminoacetyl)amino]-3-methylbenzoate

Synonyms 2-(2-Diethylaminoacetoacetamido)-*m*-toluic acid methyl ester; 2-methyl-6-carbomethoxy-*N*-diethylaminoacetanilide; methyl 2-diethylaminoacetoamido-*m*-toluate; 3-methyl-2-diethylaminoacetylaminobenzoic acid methyl ester.

Chemical Properties Oil. Bp 190° to 192° [O'Neil *et al.* 2006]. Insoluble in water, soluble in chloroform. Log *P* (octanol/water) 2.2 [National Institutes of Health 2008]; 2.3 [Meylan, Howard 1995].

Tolycaine Hydrochloride

C₁₅H₂₂N₂O₃.HCl = 314.8
CAS—7210-92-6

IUPAC Name Methyl 2-[(2-diethylaminoacetyl)amino]-3-methylbenzoate hydrochloride

Proprietary Name Baycain

Chemical Properties Crystals. Mp 139° to 140.5° [O'Neil *et al.* 2006]. Soluble in water.

Colour Test Vitali's test—*—/—*yellow (limit of detection, 1.0 µg).

Thin-layer Chromatography System T1—R_f 0.70 (location under ultraviolet light, green fluorescence; location reagent acidified iodoplatinate spray, positive reaction).

Ultraviolet Spectrum Water—283 nm.

Note For a spectrophotometric assay of tolucaine, see de Freitas [1977].

Dose Used as a 3% solution with adrenaline and noradrenaline.

Topiramate

Antiepileptic

C₁₂H₂₁NO₈S = 339.4

CAS—97240-79-4

Synonyms 2,3:4,5-Bis-O-(1-methylethylidene)-β-D-fructopyranose sulfamate; McN-4853; RWJ-17021-000.

Proprietary Names *Topamax*; *Topimax*.

Chemical Properties A white crystalline powder. Extraction yield (chlorobutane), 0.2 [Demme *et al.* 2005]. Freely soluble in acetone, in alcohol, in chloroform and in dimethyl sulfoxide.

Gas Chromatography System GB—RI 2253.

Column: DB-1 methylsilicone (30 m × 0.25 mm, 0.25 µm). Temperature: 230°. Carrier gas: H₂, flow rate 31 mL/min. Detection: flame ionisation. Retention time: 3.2 min [Gidal, Lensmeyer 1999].

Quantification

Plasma GC Column: DB-5 fused silica capillary (25 m × 0.32 mm i.d., 0.25 µm). Temperature: 165° to 205° at 9°/min. Carrier gas: He, flow rate 3 mL/min. Detection: flame ionisation. Retention time: 5 min. Limit of detection, 0.1 mg/L [Holland *et al.* 1988].

Disposition in the Body Topiramate is rapidly and well absorbed after oral administration. The rate of absorption is delayed with the presence of food but the extent is not affected. Peak plasma concentrations are attained after about 2 h. It displays linear pharmacokinetics. Topiramate undergoes rapid distribution and there is significant binding to red blood cells. It is not extensively metabolised (about 20%); up to 50% of a dose may undergo metabolism in patients taking other enzyme-inducing anti-epileptics, for example, phenytoin. The presence of these antiepileptics may also reduce the plasma concentration of topiramate, increase the clearance of the drug and decrease its half-life. Metabolic pathways include, hydroxylation, hydrolysis and glucuronidation and in total six metabolites have been identified. The drug is eliminated mainly in urine as the unchanged drug

(a total of 55 to 66% of the dose) and its metabolites (35%). There is some renal tubular reabsorption. It is removed by haemodialysis.

Therapeutic Concentration

Healthy volunteers were administered with 100, 200, 400, 800 and 1200 mg topiramate and peak concentrations of 1.7, 3.7, 7.7, 18.4 and 28.7 mg/L were observed, respectively. These concentrations were seen 1.8 to 4.3 h after administration of the drug [Easterling *et al.* 1988].

Group 1: Seven renally impaired patients with creatinine clearance <30 mL/min. Group 2: Seven renally impaired patients with creatinine clearance between 30 and 69 mL/min. Groups 3 and 4: Seven individuals with normal renal function, creatinine clearance ≥70 mL/min. Each group was administered with a single, oral dose of 100 mg topiramate and peak concentrations were 2.1, 2.2, 1.9 and 1.6 mg/L, respectively, for the 4 groups [Gisclon *et al.* 1993].

Bioavailability 80 to 95%.

Half-life Plasma, 20 to 30 h.

Volume of Distribution 0.6 to 0.8 L/kg. In women it is approximately half of that in men although this difference is not considered clinically significant.

Clearance Plasma, 1.2 to 2.4 L/h; decreased in patients with renal or hepatic impairment.

Distribution in Blood Topiramate significantly binds red blood cells and the major proportion of the circulating drug is bound to erythrocytes. Saturation of the binding sites occurs rapidly with higher drug concentrations and hence, the blood:plasma ratio decreases with increasing drug concentration.

Protein Binding 13 to 17%.

Note For reviews of topiramate, see Langtry *et al.* [1997] and Sachdeo [1998]; for reviews of the pharmacokinetics of topiramate, see Bialer [1993] and Perucca and Bialer [1996].

Topotecan

Antineoplastic

C₂₃H₂₃N₃O₅ = 421.5

CAS—123948-87-8

Synonyms (4S)-10-[(Dimethylamino)methyl]-4-ethyl-4,9-dihydroxy-1H-pyrano-[3',4':6,7]indolizino[1,2-b]quinoline-3,14(4H,12H)-dione; hycamtamine; SKF-104864A; SKFS-104864-A.

Proprietary Name *Hycamtin*

Chemical Properties Soluble in water, methanol and dimethylformamide; insoluble in ethanol. pK_a 10.5. Log *P* (octanol/water), –0.88.

Topotecan Hydrochloride

C₂₃H₂₃N₃O₅.HCl = 457.9

CAS—119413-54-6

Synonym NSC-609669

Proprietary Name *Hycamtin*

Chemical Properties A light yellow to greenish powder. Mp 213° to 218°. Soluble in water up to 1 g/L.

Ultraviolet Spectrum Aqueous acid—223, 267, 295, 316 nm.

Mass Spectrum Principal ions at m/z 44, 45, 42, 58, 43, 59, 41, 57.

Quantification

Plasma HPLC Column: BDS C₁₈ Hypersil (100 × 3 mm i.d., 3 μm). Mobile phase: 10 mmol/L potassium hydrogen phosphate (pH 6.0) containing methanol (25%) and ethylamine (0.2%), flow rate 0.70 mL/min. Fluorescence detection (λ_{ex} =381 nm, λ_{em} =525 nm). Retention time: topotecan (closed ring form), 6.5 min; (open ring form), 2.5 min. Limit of quantification, 0.10 μg/L [Loos *et al.* 1996]. Fluorescence detection (λ_{ex} =361 nm, λ_{em} =527 nm). Limit of quantification, 0.05 μg/L [Rosing *et al.* 1995]. Column: RP-18 Lichrosorb (125 × 4 mm i.d., 5 μm). Mobile phase: methanol:water:0.25 mol/L sodium dioctylsulfosuccinate (DOSS):phosphate buffer:1.0 mol/L triethylamine (pH 6.0, 567:375:35:20:3), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} =381 nm; λ_{em} =527 nm). Retention time: 5.52 min. Limit of quantification, 1.0 μg/L, limit of detection, 0.2 μg/L [Beijnen *et al.* 1990].

Disposition in the Body Topotecan is rapidly absorbed following oral administration. It is widely and rapidly distributed throughout the body following IV administration. Topotecan undergoes reversible hydrolysis of the lactone ring to the inactive hydroxy acid form, and only small amounts are demethylated in the liver. A significant proportion (30%) of a dose is excreted in urine via the kidneys. Peak maximum concentrations are reached within 45 min. The concentration of the drug in cerebrospinal fluid is 29% of the plasma concentration. Topotecan exhibits substantial inter-individual pharmacokinetics.

Therapeutic Concentration

The lactone mean peak plasma concentrations following a 30 min infusion ranged from 9 to 35 μg/L after dosages. Following 21 days of continuous infusion of dose 0.4 to 0.6 mg/m² per day, steady state plasma lactone and total concentrations were 2.3 to 5.5 μg/L and 6.7 to 8.9 μg/L, respectively. Following oral administration peak plasma lactone concentrations were 5.9 and 48 μg/L after 1.5 and 14 mg/m² [Herben *et al.* 1996].

Toxicity One patient on a single dose regimen of 17.5 mg/m² was given on day one of a 21-day cycle a single dose of 35 mg/m². They experienced severe neutropenia 14 days later but recovered without incident.

Bioavailability Oral, 20 to 55%.

Half-life 2 to 3 h.

Volume of Distribution Initial, 17 to 22 L/m². At steady state, 75 to 91 L/m².

Clearance Approximately 24%. Clearance is higher in males than females. It decreases to about 67% of the normal value in patients with mild renal impairment; to about 34% of the normal value in those with moderate renal impairment; and about 67% of the norm in patients with hepatic impairment.

Protein Binding Approximately 35%.

Dose 1.5 mg/m².

Beijnen JH *et al.* (1990). High-performance liquid chromatographic analysis of the new antitumour drug SK&F 104864-A (NSC 609699) in plasma. *J Pharm Biomed Anal* 8: 789–794.

Torasemide

Diuretic

C₁₆H₂₀N₄O₃S = 348.4

CAS—56211-40-6

IUPAC Name 1-[4-(3-Methylanilino)pyridin-3-yl]sulfonyl-3-propan-2-ylurea

Synonyms AC-4464; BM-02015; JDL-464; N-[[[(1-methylethyl)amino]carbonyl]-4-[(3-methylphenyl)amino]-3-pyridinesulfonamide]; torsemide.

Proprietary Names Demadex; Dilutol; Isodiur; Sutril; Torem; Torrem; Unat.

Chemical Properties Mp 163° to 164°. pK_a 6.44, 7.1.

Torasemide Sodium

CAS—72810-59-4

High Performance Liquid Chromatography Column: ODS Ultrasphere (75 × 4.6 mm i.d., 3 μm). Mobile phase: acetonitrile: 100 mmol/L ammonium acetate (pH 3; 10:90 to 15:85 in 2 min, to 55:45 in 3 min, to 60:40 in 3 min, for 1 min, to 10:90 in 1 min, for 2 min, flow rate 1 mL/min. UV detection (λ =270, 290 nm). Retention time: 5.2 min [Ventura *et al.* 1993].

Ultraviolet Spectrum Principal peak at 289 nm.

Mass Spectrum Principal ions at m/z 181, 263, 246, 182, 198, 154, 91, 65.

Quantification

Plasma HPLC Column: Nucleosil C₁₈ (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: 100 mmol/L potassium dihydrogen phosphate (pH 4.5; 14:86 for 8 min, to 30:70 for 3.5 min, to 21:79 for 8.5 min, to 40:60 for 2 min, to 21:79 for 10 min, to 14:86 for 6 min), flow rate 1.3 mL/min. UV detection (λ =290 nm). Retention time: 18.2 min. Limit of quantification, 0.01 mg/L [March *et al.* 1990]. Column: C₁₈ Nucleosil 10 (250 × 4.6 mm i.d.). Mobile phase: acetonitrile:0.01 mol/L sodium dihydrogen phosphate (pH 3.0; 78:22 to 60:40 in 5 min, to 40:60 in 5 min, to 25:75) in 5 min, to 78:22 in 20 min. Retention time: 10 min. Limit of detection, 0.04 mg/L [Besenfelder 1987]. UV detection (λ =290 nm). Limit of detection, 0.02 mg/L [Broekhuysen *et al.* 1986].

Urine GC-MS Column: DB-1701 capillary (30 m × 0.25 mm i.d., 0.25 μm). Temperature: 40°, held 1 min, then 20°/min to 300°. Carrier gas: He. EI, MID at m/z 197 and 305). Retention time: 18.24 min. Limit of quantification, 0.5 ng (1 μL injection) [Barroso *et al.* 1997].

HPLC See Plasma [Broekhuysen *et al.* 1986]. See Plasma. Limit of quantification, 0.02 mg/L [March *et al.* 1990].

Disposition in the Body Torasemide is almost completely absorbed rapidly from the gastrointestinal tract with little first-pass metabolism. Food does not alter the absorption and is unaffected by renal or hepatic dysfunction. Peak serum concentrations are achieved within 1 h of oral administration. It is cleared from the circulation by both hepatic metabolism and excretion into urine (≈20% of total clearance). Very little drug enters urine via glomerular filtration. Most renal clearance occurs via active secretion of the drug by the proximal tubules into tubular urine. Three metabolites are formed (M1, M3 and M5) by stepwise oxidation,

hydroxylation or ring hydroxylation. The total amount of torasemide and metabolites recovered in urine is 83%; 25% torasemide, 11% M1, 3% M3 (both active) and 44% M5 (inactive). Kinetics are linear with dosage.

Therapeutic Concentration

Fifteen patients with moderate chronic renal insufficiency (creatinine clearance, 30–60 mL/min), mean age of 63.3 years, and 16 patients with severe insufficiency (creatinine clearance, <30 mL/min), mean age 52.8 years, were administered with 20, 50 and 100 mg oral doses of torasemide, and 50, 100 and 200 mg doses, respectively. The mean peak drug concentrations were 2.95, 6.68 and 11.1 mg/L for the 20, 50 and 100 mg doses received by the patients with moderate impairment. These concentrations were observed at 0.94, 1.03 and 1.36 h, respectively. The mean drug concentration for the 50, 100 and 200 mg doses administered to the patients with severe impairment were 6.11, 11.3 and 18.5 mg/L at 1.18, 1.05 and 1.56 h, respectively [Gehr *et al.* 1994].

Twelve patients with ascites caused by cirrhosis, aged between 38 and 66 years, with a creatinine clearance 63 to 127 mL/min, were administered with an oral dose of 10 mg or IV over a 30-min period. The patients fasted overnight and for 4 h after dosing. The peak plasma concentrations were 1.7 mg/L for the IV dose observed at 0.52 h and 1.45 mg/L at 0.71 h for the oral dose. For healthy individuals receiving the same oral dose, the peak concentration was 1.27 mg/L at 0.86 h [Schwartz *et al.* 1993].

Sixteen patients with congestive heart failure (New York Heart Association class II or III), aged between 39 and 81 years, were administered with 10 mg orally or IV (over a 30-min infusion). The peak concentration with the IV dose was 2.9 mg/L after 0.6 h and 1.5 mg/L at 1.1 h for the orally administered dose [Vargo *et al.* 1995].

Bioavailability 80–90%; 76% (elderly).

Half-life 2.2–3.5 h.

Volume of Distribution 11–16.5 L or 0.09–0.31 L/kg; this value may increase by approximately double in individuals with hepatic cirrhosis.

Clearance Following a 10 mg dose, total clearance is 0.72 ± 0.23 mL/s; renal clearance 0.11 ± 0.04 mL/s. After a 20 mg oral dose, total clearance is 3.4 L/h; renal clearance 0.43 L/h. After an IV dose, total clearance is 2.2–2.6 L/h and renal clearance 0.38 to 0.53 L/h. Systemic clearance is 41 mL/min. Renal clearance is reduced in individuals with renal impairment.

Protein Binding >99%.

Dose Oedema: usual dose is 5 mg, increased to 20 mg once daily if necessary, maximum 40 mg. Hypertension: 2.5 mg daily, increased to 5 mg if necessary.

Toremifene

Antioestrogen, Antineoplastic

C₂₆H₂₈ClNO = 406.0

CAS—89778-26-7

IUPAC Name 2-[4-[(Z)-4-Chloro-1,2-diphenylbut-1-enyl]phenoxy]-N,N-dimethylethanamine

Proprietary Name Fareston

Chemical Properties Mp 108° to 110°. pK_a 8.0.

Toremifene Citrate

C₂₆H₂₈ClNO, C₆H₈O₇ = 598.1

CAS—89778-27-8

Proprietary Name Fareston

Chemical Properties Mp 160° to 162°.

High Performance Liquid Chromatography Column: C₁₈ NovaPak (250 × 4 mm i.d., 5 μm). Mobile phase: acetonitrile: 100 mmol/L ammonium acetate: triethylamine (pH 6, 46: 54: 0.05), flow rate 1 mL/min. UV detection (λ=220 nm). Retention time: 25 min [Berthou, Dréano 1993].

Ultraviolet Spectrum Aqueous acid—236 nm.

Mass Spectrum Principal ions at m/z 58, 72, 59, 405.

Quantification

Plasma HPLC UV detection (λ=277 nm). Limit of detection, about 0.2 mg/L for toremifene and metabolites [Webster *et al.* 1991].

Urine HPLC See Plasma. For a method of quantification for toremifene and metabolites, see Webster *et al.* [1991].

HPLC-MS Column: CN Zorbax (250 × 4.6 mm i.d., 5 μm). Mobile phase: 0.1 mol/L ammonium acetate (pH 8) in 70% methanol, flow rate 1.2 mL/min. MS detection (API, SIM at toremifene, m/z 392; N-desmethyltoremifene, m/z 406; 4-hydroxytoremifene, m/z 408). Retention time: toremifene, 19.5 min; N-desmethyltoremifene, 16.0 min; 4-hydroxytoremifene, 13.7 min. For a method of quantification for metabolites, see Watanabe *et al.* [1989].

Disposition in the Body Toremifene is well absorbed after oral administration and absorption is not influenced by food. Peak plasma concentrations are attained within 3 h. This drug shows linear pharmacokinetics. Toremifene is extensively metabolised primarily by CYP3A4. It is metabolised by N-demethylation, p-hydroxylation and side chain oxidation to N-desmethyltoremifene, which also has anti-oestrogenic properties but only weak *in vitro* antitumour activity. Other metabolites include deamino-hydroxy-toremifene, 4-hydroxy-toremifene and di-desmethyl-toremifene. It also undergoes entero-hepatic circulation. The drug is eliminated as metabolites mainly in faeces (70%). About 10% is excreted in urine during a 1-week period as metabolites. Toremifene accumulates during repeated dosing.

Therapeutic Concentration

Four groups of subjects, aged between 32 and 75 years, were administered with a single oral dose of 120 mg after an overnight fast and fasting was continued for 3 h after dosing. Group 1 comprised 10 normal, healthy subjects; group 2 comprised 10 patients with impaired liver function (alcohol related); group 3 comprised 10 patients with drug-activated liver dysfunction; and group 4 comprised 10 subjects with impaired renal function (stable, chronic renal impairment). Mean peak plasma drug concentrations were 0.414, 0.523, 0.384 and 0.498 mg/L for the four groups, respectively. These concentrations were observed after 2 h (range, 0.5 to 8 h). Peak concentrations for the metabolite, N-desmethyltoremifene, were 0.130, 0.142, 0.196 and 0.136 μg/L for groups 1, 2, 3 and 4 observed at approx. 72, 7, 16 and 24 h, respectively [Anttila *et al.* 1995].

Half-life Plasma half-life, toremifene, 5 days; N-desmethyltoremifene, 6 days.

Protein Binding >99.5%, mainly to albumin.

Note For a review of toremifene, see Wiseman and Goa [1997].

Dose The equivalent of 60 mg of toremifene daily.

Tosylchloramide Sodium

Disinfectant

$C_7H_7ClNNaO_2S \cdot 3H_2O = 281.7$

CAS—127-65-1 (anhydrous)

IUPAC Name Sodium *N*-chloro-4-methylbenzenesulfonamide trihydrate

Synonyms Chloramidum; chloramine; chloramine T; cloramina; mianin; natrium sulfaminochloratum.

Note The name chloramin is applied to a preparation of chlorphenamine maleate.

Proprietary Names Hydroclonazone; Klortee.

Chemical Properties A white or slightly yellow crystalline powder. It effloresces in air, losing chlorine, becoming yellow in colour and less soluble in water. Soluble 1 in 7 of water and 1 in 2 of boiling water; soluble 1 in 12 of ethanol, with slow decomposition; practically insoluble in benzene, chloroform and ether.

Thin-layer Chromatography System TA— R_f 0.40; system TAK— R_f 0.18; system TAL— R_f 0.68.

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1165, 1316, 1105, 825, 710, 920 cm^{-1} (KCl disk).

Use As a 2% solution for wound irrigation.

Tramadol

Narcotic Analgesic

$C_{16}H_{25}NO_2 = 263.4$

CAS—27203-92-5

IUPAC Name (1*R*,2*R*)-2-(Dimethylaminomethyl)-1-(3-methoxyphenyl)cyclohexanol-1-ol

Chemical Properties pK_{a1} 8.3; pK_{a2} 9.41. Log *P* (water pH 7/*n*-octanol), 1.35; (octanol/water), 3.01. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Tramadol Hydrochloride

$C_{16}H_{25}NO_2 \cdot HCl = 299.8$

CAS—22204-88-2

Synonyms CG-315; CG-315E; U-26225A.

Proprietary Names Dromadol; Tramake; Tramal; Ultram; Zamadol; Zydol.

Chemical Properties A white, bitter, odourless crystalline powder. Mp 180° to 181°. Readily soluble in water and ethanol.

Thin-layer Chromatography System TE— R_f 0.78; system TAE— R_f 0.30.

Gas Chromatography System GA—tramadol RI 1943, M (nor-)-AC RI 2295, M (O-desmethyl-)-RI 1995, M (O-desmethyl-)-AC RI 1998, M (N,O-didesmethyl-)-AC₂RI 2464, M (OH-)-RI 2200; system GB—tramadol RI 2021, M (nor-)-RI 2049, M (O-desmethyl-)-RI 2093, M (N,O-didesmethyl-)-RI 2122, M (OH-)-RI 2252.

High Performance Liquid Chromatography System HX—RI 328; system HY—RI 267; system HZ—RT 2.9 min.

Column: LiChrosorb RP-18 (250 × 4.6 mm i.d., 5 μ m). Mobile phase: 0.01 mol/L phosphate buffer (pH 5.9): acetonitrile with 0.1% triethylamine (70:30), flow rate

0.75 mL/min. UV detection ($\lambda = 218$ nm). Retention time 11.4 min. *k* value 2.09 [Gan, Ismail 2001].

Column: Asahipack ODP-50 (125 × 4.0 mm i.d., 5 μ m). Mobile phase: 0.01 mol/L borate buffer (pH 9): methanol (40:60), flow rate 0.7 mL/min. Electrochemical detection. Retention time: 10.5 min [Valle *et al.* 1999].

Column (1): Separon SGX C₁₈ compact glass cartridge (150 × 3.3 mm i.d., 5 μ m). Mobile phase: 4 g hexanesulfonic acid sodium salt monohydrate dissolved in 400 mL 0.02 mol/L phosphoric acid (1.28 mL 85% phosphoric acid in 1000 mL water), and mixed with 600 mL acetonitrile, flow rate 0.9 mL/min. UV detection ($\lambda = 275$ nm) and fluorescence detection ($\lambda_{ex} = 202$ nm, $\lambda_{em} = 296$ nm). Retention time: 4.34 min.

Column (2): LiChrospher 100 RP-18 (250 × 4 mm i.d., 5 μ m). Mobile phase: 4 g hexanesulfonic acid sodium salt monohydrate in 600 mL phosphoric acid and 400 mL acetonitrile. Retention time: 4.4 min [Nobilis *et al.* 1996].

Ultraviolet Spectrum Aqueous acid—272 ($A_1 = 70a$), shoulder at 279 nm. No alkaline shift.

Infrared Spectrum Principal peaks at wavenumbers 1284, 1601, 1042, 1238, 1575, 702 cm^{-1} (tramadol hydrochloride, KBr disk).

Mass Spectrum

Quantification

Blood HPLC Column: Varian Pursuit 3 C₁₈ (100 × 3.0 mm i.d., 3 μ m). Mobile phase: methanol: ammonium formate. Limit of quantification, 0.5–10 μ g/kg [Bjork *et al.* 2010].

LC-MS Column: Gemini C₁₈ (100 × 2.0 mm i.d., 3 μ m). Mobile phase: acetonitrile containing 0.1% formic acid: ammonium acetate (pH 3.2, 15:85 for 9 min to 30:70 in 13 min to 80:20 in 10 min to 95:5 in 1 min), flow rate 150 μ L/min. TIS, MRM acquisition mode. Retention time: 6.3 min. Limit of detection, 0.002 mg/L [Gergov *et al.* 2009].

Plasma GC Column: RTX 10024 capillary (30 m × 0.32 mm i.d., 0.25 μ m). Temperature programme: 100° to 250° at 10°/min for 8 min. Carrier gas: N₂, 1 mL/min. FID. Retention time: 11.53 min. *k* value 13.41. Limit of detection, 8 μ g/L [Ho *et al.* 1999].

GC-MS Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 μ m). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 1 min to 280° at 20°/min for 15 min. EI ionisation at 70 eV. Limit of detection, 0.2 μ g/L [Sha *et al.* 2005]. Column: SGE BPX5 (15 m × 0.25 mm i.d., 0.25 μ m). Carrier gas: He, 1.5 mL/min. Temperature programme: 100 for 1 min to 300° at 40°/min for 2 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 5 μ g/L [Leis *et al.* 2004]. Column: HP-1 cross-linked methyl silicone (12 m × 0.2 mm i.d., 0.33 μ m). Carrier gas: He, 1.2 mL/min. Temperature programme: 70° to 210° at 40°/min to 230° at 8°/min to 300° at 10°/min. SIM acquisition mode. Limit of quantification, 40 μ g/L, limit of detection, 10 μ g/L [Gambaro *et al.* 2003]. Column: HP-5-MS capillary (30 m × 0.25 mm i.d., 0.25 μ m). Temperature programme: 140° to 260° at 24°/min for 4 min. Carrier gas: He, 1 mL/min. SIM acquisition mode (*m/z* 263, 179). Retention time: 6.03 min. Limit of detection, 1 μ g/L [Merslavic, Zupancic-Kralj 1997].

HPLC Column: RP-18. Mobile phase: *o*-phosphoric acid: triethylamine: acetonitrile: methanol. Fluorescence detection ($\lambda_{ex} = 200$ nm, $\lambda_{em} = 300$ nm; $\lambda_{ex} = 200$ nm, $\lambda_{em} = 295$ nm; $\lambda_{ex} = 212$ nm, $\lambda_{em} = 305$ nm). Limit of quantification, 4.078 μ g/L [Curticepan *et al.* 2008]. Column: AGP, α_1 -acid glycoprotein chiral

T

selector. Mobile phase: 30 μmol/L diammonium hydrogen phosphate buffer: acetonitrile:triethylamine (pH 7, 98.9:1:0.1), flow rate 0.5 mL/min. Fluorescence detection (λ_{ex} = 200 nm, λ_{em} = 301 nm). Limit of quantification, 2 μg/L [Ardakani *et al.* 2008]. Column: RP-18e (100 × 4.6 mm i.d.). Mobile phase: methanol:water (pH 2.5, 19:81), flow rate 2.0 mL/min. Fluorescence detection (λ_{ex} = 200 nm, λ_{em} = 301 nm). Limit of detection, 0.12 μg/L [Ebrahimzadeh *et al.* 2008]. Column: Chiralpak AD. Mobile phase: hexane:ethanol:diethylamine (94:6:0.2), flow rate 1 mL/min. Fluorescence detection (λ_{ex} = 275 nm, λ_{em} = 300 nm). Limit of quantification, 2.5 μg/L [Mehvar *et al.* 2007]. Column: Chromolith Performance RP-18e (50 × 4.6 mm i.d.). Mobile phase: methanol:water (pH 2.5, 13:87), flow rate 2 mL/min. Fluorescence detection (λ_{ex} = 200 nm, λ_{em} = 301 nm). Limit of quantification, 2.5 μg/L [Rouini *et al.* 2006]. See also Campanero *et al.* [2004], Gan, Ismail [2001], Gu, Fawcett [2005], Nobilis *et al.* [1996], Nobilis *et al.* [2002], Qu *et al.* [2003], Valle *et al.* [1999] and Yeh *et al.* [1999].

LC-MS Column: Diamonsil C₁₈. Mobile phase: 5 mmol/L ammonium acetate: methanol (50:50), flow rate 0.8 mL/min. Limit of quantification, 1 μg/L [Liu *et al.* 2009]. Column: Zorbax SB-C₁₈ (100 × 3.0 mm i.d., 3.5 μm). Mobile phase: acetonitrile:0.2% trifluoroacetic acid in water (10:90), flow rate 1 mL/min. ESI, SIM acquisition mode. Retention time, 3.5 min. Limit of quantification, 2.1 μg/L [Vlase *et al.* 2008].

Serum GC Column: FS-SE30-CB-0,25 (25 m × 0.32 mm i.d.). Carrier gas: He, 60 cm/s. Temperature programme: 100° to 240° at 32°/min. NSD. Limit of detection, ~3 μg/L [Becker, Lintz 1986].

GC-MS SIM acquisition mode. Limit of detection, 21 μg/L [Zhu *et al.* 2006]. Column: ARNC-SE-30 (25 m). Carrier gas: He, 2 mL/min. Temperature programme: 80° to 240° at 25.5°/min. SIM acquisition mode. Limit of detection, ~4 μg/L [Lintz, Uragg 1985].

Urine GC-MS Column: Rt-βDEXct, (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 70 kPa. Temperature programme: 120° to 230° at 2.5°/min for 10 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 0.1 mg/L, limit of detection, 0.01 mg/L [Chytil *et al.* 2009]. Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 130° to 170° at 10°/min to 200° at 5°/min to 250° at 10°/min. EI ionisation, SIM acquisition mode. Limit of quantification, <30 μg/L [Cheng *et al.* 2008].

HPLC See Plasma [Ebrahimzadeh *et al.* 2008].

LC-MS See Blood. Limit of detection, 0.007 mg/L [Gergov *et al.* 2009]. See Plasma [Liu *et al.* 2009].

Hair GC-MS Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.2 mL/min. Temperature programme: 60° for 5 min to 280° at 15°/min for 5 min. TIC, SIM acquisition mode. Limit of detection, 0.2 ng/mg [Hadidi *et al.* 2003].

Liver HPLC Column: reversed phase C₁₈. Mobile phase: methanol:ammonium hydrogen carbonate solution: ammonium hydroxide solution. Fluorescence detection (λ_{ex} = 280 nm, λ_{em} = 310 nm). Limit of detection, 500 μg/L [Paar *et al.* 1996].

Disposition in the Body Tramadol is rapidly and almost completely absorbed after oral or parenteral administration; bioavailability is ~75%. The presence of food does not significantly affect the rate or extent of absorption. As the drug is administered as the racemate, both (–)- and (+)-tramadol and metabolites are detected in circulation. Peak serum concentrations are achieved in ~2 h. Tramadol is extensively metabolised. The main metabolic reactions are *N*- and *O*-demethylation and conjugation with glucuronic acid and sulfate. The major metabolites formed are *O*-monodesmethyltramadol, *N,O*-didemethyltramadol and their conjugates, and *N*-monodesmethyltramadol. *O*-Monodesmethyltramadol is an active metabolite and has a greater analgesic activity than the parent drug. The extent of metabolism is reduced in patients with hepatic impairment. Approximately 90% of an oral dose is excreted in the urine in 3 days, ~30% of the dose as unchanged drug and the rest as metabolites. The remainder of the dose is eliminated in the faeces. The rate and extent of excretion is reduced in patients with renal impairment. The drug is widely distributed throughout the body and crosses the placenta; it has also been detected in breast milk. Steady-state concentrations of both the drug and main metabolite are achieved within 2 days of multiple dosing.

Therapeutic Concentration The therapeutic tramadol blood concentration is 100–800 μg/L.

Twelve male and female healthy subjects (mean age 30.1 years; range, 21–41) were fasted overnight for 12 h and administered a single oral 150-mg dose tramadol hydrochloride (as drops without ethanol) in the morning and as an IV 30-min infusion, with a 1-week washout period between doses. The mean peak serum concentration was 136 μg/L observed at a median of 1.1 h (minimum 0.74 h and maximum 1.5 h). After the IV dose, a maximum concentration of 286.8 μg/L at 0.52 h was observed [Lintz *et al.* 2000].

Twelve healthy males received a single 50-mg dose tramadol hydrochloride either as an IM injection or as a 30-min IV infusion, after an overnight fast (with a 1-week washout period between doses). After the IM injection, a mean peak serum tramadol concentration of 0.166 mg/L was reached after 0.75 h; after the IV infusion, a peak of 0.293 mg/L was reached at 0.5 h [Lintz *et al.* 1999].

Ninety-two patients who were recovering from major gynaecological surgery were given a maximum IV dose of 200 mg (+)-tramadol, (–)-tramadol or racemic tramadol; a 20-mg dose of each was also administered, as requested, for 24 h. Drug and metabolite serum concentrations were measured before each additional dose. The mean tramadol concentration was 470 μg/L for (+)-tramadol, 590 μg/L for the racemate and 771 μg/L for (–)-tramadol. The mean *O*-desmethyltramadol concentration was 57, 84 and 96 μg/L for the 3 drug types, respectively [Grond *et al.* 1999].

Ten healthy, female subjects (aged 38–57 years; mean, 48.7) were administered with 100 mg tramadol hydrochloride as a rectal suppository and as an IV injection with a washout period of 1 week between doses. Doses were given after a 12-h overnight fast. The mean maximum serum concentration was 294 μg/L observed at 3.3 h (range, 2–6) for the suppository dose. After the IV dose, a concentration of 603.1 μg/L was observed at 0.25 h [Lintz *et al.* 1998].

Toxicity The toxic tramadol blood concentration is 1.0 mg/L; lethal, 2.0 mg/L.

A 26-year-old male nurse returned home from work after a night shift and went to bed to sleep. Later that evening, he was found dead face down on his bed. A bottle of tramadol was found in his pocket. The peripheral blood tramadol concentration was 9.6 mg/L, which is ~30 times the observed therapeutic concentration range (0.1–0.3 mg/L). The heart blood concentration was 13.1 mg/L, urine 46.0 mg/L, bile 46.1 mg/L, liver 6.2 μg/g and kidney 3.1 μg/g. There was also a trace of the drug detected in the gastric contents. No other drugs or alcohol were detected [Musshoff, Madea 2001].

A 30-year-old woman was found dead at her home after ingestion of unknown amounts of alprazolam, tramadol and alcohol (empty packages of each found at the scene). She had a history of depression. Toxicological analysis showed concentrations of tramadol in her peripheral blood at 38.3 mg/L (~100 times the therapeutic concentration). Alprazolam was found at a concentration of 0.21 mg/L and alcohol at 1.29 mg/g. Tramadol was also detected at concentrations of 44.0 mg/L in bile, 27.6 μg/g in liver and 130 mg total in gastric contents; alprazolam was found in these samples at 0.27 mg/L, 0.23 μg/g and 2.73 mg, respectively [Michaud *et al.* 1999].

In a fatal overdose case involving tramadol, the tramadol concentration in various tissues and fluids was blood 20 mg/L, liver 68.9 μg/g, kidney 37.5 μg/g and urine 110.2 mg/L. In all body tissues and blood, the drug concentration was greater than the metabolites *N*-desmethyl and *O*-desmethyltramadol; *O*-desmethyltramadol was always greater in concentration than the *N*-desmethyl metabolite [Moore *et al.* 1999].

Analysis of 12 blood samples from tramadol-related death and 4 from non-fatal tramadol intoxications revealed concentrations ranging from 0.03–22.59 mg/L for tramadol, 0.02–1.84 mg/L for *O*-desmethyltramadol and 0.01 to 2.08 mg/L for *N*-desmethyltramadol. Three of the deaths were attributable to morphine and 1 to doxapin; 6 were multiple drug overdoses [Goeringer *et al.* 1997].

Half-life Plasma half-life: tramadol ~6 h (increases to 7 h with multiple dosing); *O*-monodesmethyltramadol, ~9 h.

Volume of Distribution ~3 L/kg; slightly higher in females than in males (2.9 L/kg versus 2.6 L/kg).

Clearance Plasma clearance, ~6 mL/min/kg; slightly higher in males than in females (6.4 mL/min/kg versus 5.7 mL/min/kg).

Protein Binding 20%.

Dose Tramadol hydrochloride is given in doses of 50 to 100 mg orally, not more often than every 4 h (no more than 400 mg daily required); IM injection or IV injection/infusion, 50 to 100 mg every 4 to 6 h (for postoperative pain, 100 mg initially followed by 50 mg every 10 to 20 min; total maximum, 250 mg in first hour, then as before).

Tramazoline

Sympathomimetic

$C_{13}H_{17}N_3 = 215.3$

CAS—1082-57-1

IUPAC Name *N*-(5,6,7,8-Tetrahydronaphthalen-1-yl)-4,5-dihydro-1*H*-imidazol-2-amine

Synonym 4,5-Dihydro-*N*-(5,6,7,8-tetrahydro-1-naphthalenyl)-1*H*-imidazol-2-amine

Chemical Properties Crystals. Mp 142° to 143°. Log *P* (chloroform/pH 7.4) 0.8; (octanol/water) 2.5.

Tramazoline Hydrochloride

$C_{13}H_{17}N_3 \cdot HCl = 251.8$

CAS—3715-90-0

Proprietary Names *Biciron; Bisolnasal; Ellatun; Rhinospray; Rinogutt Spray-Fher; Spray-Tish*. It is an ingredient of *Dexa-Rhinaspray*.

Chemical Properties A white crystalline solid. Mp 171°. Soluble 1 in 6 of water.

Colour Tests Mandelin's test—brown; Marquis test—red-violet.

Thin-layer Chromatography System TA— R_f 0.06; system TAE— R_f 0.04; system TL— R_f 0.02; system TB— R_f 0.04; system TC— R_f 0.02; system TE— R_f 0.30 (acidified potassium permanganate solution, positive).

Gas Chromatography System GA—RI 2440.

High Performance Liquid Chromatography System HA—*k* 1.8; system HX—RI 341.

Ultraviolet Spectrum Aqueous acid—267, 275 nm.

Infrared Spectrum Principal peaks at wavenumbers 1667, 1626, 1590, 1302, 797, 1289 cm^{-1} (tramazoline hydrochloride, KBr disk).

Mass Spectrum Principal ions at *m/z* 215, 214, 44, 185, 200, 216, 157, 186.

Trandolapril

Antihypertensive

$C_{24}H_{34}N_2O_5 = 430.5$

CAS—87679-37-6

IUPAC Name (2*S*,3*aR*,7*aS*)-1-[(2*S*)-2-[[[(2*S*)-1-Ethoxy-1-oxo-4-phenylbutan-2-yl]amino]propanoyl]-2,3,3*a*,4,5,6,7,7*a*-octahydroindole-2-carboxylic acid

Synonyms (2*S*,3*aR*,7*aS*)-1-[(2*S*)-2-[[1*S*]-1-(Ethoxycarbonyl)-3-phenylpropyl]-amino]-1-oxopropyl]octahydro-1*H*-indole-2-carboxylic acid; RU-44570; RU-44403.

Proprietary Names *Gopten; Mavik; Odrik; Zeddan*.

Gas Chromatography System GP—trandolapril-ME RI 2970; M perindoprilate-ME3 RI 3005; M perindoprilate-H₂O-ME3 RI 3070.

High Performance Liquid Chromatography System HAA—RT 17.0 min; system HZ—trandolapril retention time 6.1 min; trandolaprilat retention time 2.1 min.

Ultraviolet Spectrum

Mass Spectrum Principal ions at m/z 262, 308, 91, 124, 117, 223, 179, 160.

Quantification

Urine GC-MS Limit of detection, 10 µg/L [Maurer *et al.* 1998].

Disposition in the Body Trandolapril is very rapidly absorbed after oral administration and is not affected by food. It is a pro-drug of its metabolite, diacid trandolaprilat, which is a specific angiotensin-converting enzyme (ACE) inhibitor. The effective half-life for accumulation of trandolapril is 16 to 24 h following multiple dosing. Trandolapril is metabolised in the liver to trandolaprilat and some inactive metabolites. Peak plasma concentrations of trandolapril following an oral dose are achieved within 30 to 60 min. Peak plasma concentrations of trandolaprilat range from 4 to 6 h. Approximately 33% of an oral dose is excreted in urine, mainly as trandolaprilat, and the remainder is excreted in faeces. Excretion is virtually complete (99.2%) after 7 days, except in patients with impaired renal function where excretion is decreased. Steady state concentrations are reached in about 4 days. Trandolaprilat is eliminated in urine in the unchanged form and accounts for 10 to 15% of the dose of trandolapril administered. Modest accumulation of trandolapril occurs during multiple dosing.

Therapeutic Concentration

Ten patients with a mean age of 44.1 years, and 14 patients with a mean age 69.3 years, all with mild to moderate hypertension, were administered 2 mg trandolapril for 10 consecutive days. Steady state plasma concentrations were reached after 4 days and absorption is rapid, in less than 1 h. The steady state concentration was 7.49 µg/L for the young individuals and 8.35 µg/L in the elderly [Arner *et al.* 1994].

Bioavailability Trandolapril ~5%; trandolaprilat, 40 to 60%.

Half-life Trandopril, 1.3 h (healthy individuals and patients with mild to moderate hypertension); trandolaprilat, steady state, 16 to 24 h.

Protein Binding Trandolapril, >80%, not saturable over 0.1 to 1.0 µg/L; trandolaprilat, 65% at 1000 µg/L to 94% at 0.1 µg/L; will bind to saturation with a strong affinity in serum.

Dose The usual dose is 1 to 2 mg, maximum 4 mg.

Arner P *et al.* (1994). Pharmacokinetics and pharmacodynamics of trandolapril after repeated administration of 2 mg to young and elderly patients with mild-to-moderate hypertension. *J Cardiovasc Pharmacol* 23 (Suppl.4): S44-S49.

Tranylcypromine

Antidepressant, Monoamine Oxidase Inhibitor

$C_9H_{11}N = 133.2$

CAS—155-09-9

IUPAC Name (1*R*,2*S*)-*rel*-2-Phenylcyclopropanamine

Synonyms Tranilcypromina; transamine.

Chemical Properties Liquid. Log *P* (octanol/water), 1.58 [Hansch *et al.* 1995]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Stable in plasma and urine for up to 24 months at -20° or -80° [Spahn-Langguth *et al.* 1992].

Tranylcypromine Sulfate

$(C_9H_{11}N)_2 \cdot H_2SO_4 = 364.5$

CAS—13492-01-8

Proprietary Names Jatrosom N; Parnate; Tylcypriene. It is an ingredient of Parmodalin; Parstelin and Stelapar.

Chemical Properties White crystalline powder. Soluble 1 in 20 to 1 in 25 of water and 1 in 2000 of ether; very slightly soluble in ethanol; practically insoluble in chloroform. pK_a 8.2. Log *P* (octanol/water), 1.57 [Meylan, Howard 1995], (octanol/chloroform), 0.6.

Colour Tests Liebermann's reagent—red-orange; Mandelin's test—green→violet; Marquis test—red→brown.

Thin-layer Chromatography System TA— R_f 0.54; system TAE— R_f 0.41; system TAF— R_f 0.67; system TAG— R_f 0.48; system TB— R_f 0.39; system TC— R_f 0.33; system TE— R_f 0.58 (Dragendorff spray, positive; FPN reagent, yellow; acidified iodoplatinate solution, positive; Marquis reagent, orange-brown; ninhydrin spray, positive).

Gas Chromatography System GA—RI 1220; system GB—RI 1252; system GC—RI 1759; system GF—RI 1455.

High Performance Liquid Chromatography System HA— k 1.0; system HC— k 0.26; system HX—RI 230; system HY—RI 196; system HZ—RT 2.0 min.

Ultraviolet Spectrum Aqueous acid—258 nm, 264 nm ($A_1 = 22a$), 271 nm; aqueous alkali—260, 266, 273 nm.

Infrared Spectrum Principal peaks at wavenumbers 1023, 1112, 695, 963, 1153, 743 cm^{-1} (tranylcypromine sulfate (Nujol mull)).

Mass Spectrum Principal ions at m/z 133, 132, 56, 115, 30, 117, 91, 77.

Quantification

Blood GC Column: HP-1 (12.5 m × 0.2 mm i.d., 0.33 µm). Temperature programme: 80° to 100° at 20°/min to 200° at 10°/min to 300° at 20°/min for 5 min. NPD. Limit of quantification, 0.2 mg/L [Boniface 1991].

GC-MS Column: DB-5 (25 m × 0.2 mm i.d., 0.33 µm). Temperature programme: 100° for 1 min to 210° at 15°/min for 1 min to 270° at 30°/min for 1 min. SIM acquisition mode. Limit of detection not reported [Crisafi, Long 1997].

Plasma GC Column: OV-225 (20 m × 0.3 mm i.d.). Carrier gas: He, 2 mL/min. Temperature: 180°. NSD. Limit of detection 2.5 µg/L [Bailey, Barron 1980].

GC-MS Column: 3% OV-1 on 80/100 mesh Supelcoport (1.8 m × 2 mm i.d.). Carrier gas: CH_4 , 0.8 Torr. Temperature: 130°. CI. Retention time: 2.95 min. Limit of detection, 1 µg/L [Edwards *et al.* 1985].

HPLC Column: Novapak C_{18} (150 × 3.9 mm i.d.). Mobile phase: acetonitrile: 0.1 mol/L sodium dihydrogen phosphate containing 0.3 g/L sodium chloride and 0.76 g/L sodium 1-octanesulfoate (pH 3, 20:80), flow rate 0.5 mL/min. Electrochemical detection. k' : 4.18. Limit of detection, 5 µg/L [Krugers Dagneaux *et al.* 1992]. Column: Zorbax ODS (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L sodium phosphate solution (pH 6.5): methanol: tetrahydrofuran (50:60:1), flow rate 1.2 mL/min. Fluorescence detection ($\lambda_{ex} = 344$ nm, $\lambda_{em} = 442$ nm). Limit of detection, 0.5 µg/L [Spahn-Langguth *et al.* 1992].

Serum GC Column: CP-Sil-5CB fused silica capillary. Carrier gas: N_2 . Temperature programme: 80° to 140° at 10°/min for 1 min to 200° at 30°/min for 2 min. NPD. Limit of detection not reported [Pennings *et al.* 1997]. Column: 2% OV-1 on 100/120 mesh Chromosorb G-HP (6' × 2 mm i.d.). Carrier gas: CH_3 : Ar (5:95), 33 mL/min. Temperature: 185°. ECD. Retention time: 3.1 min for the trichloroacetyl derivatives. Limit of detection, 1 µg/L [Baselt *et al.* 1977b].

Urine GC See Blood [Boniface 1991]. See Plasma [Bailey, Barron 1980]. See Serum [Baselt *et al.* 1977b].

GC-MS See Blood [Crifasi, Long 1997]. Column: 5% phenyl-methylpolysiloxane HP-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 130° for 3 min to 146° at 4°/min for 4 min to 260° at 30°/min for 10 min. MSD. Limit of quantification, 0.06 mg/L [Iwersen, Schmoltd 1996].

HPLC Column: Crownpak CR (15 cm × 4 mm i.d., 5 μm). Mobile phase: 0.1 N perchloric acid: methanol (88:12), flow rate 0.6 mL/min. UV detection (λ=256 nm). Retention time: 12.9 and 16.4 min for R-(+)- and S-(-)-trazodone, respectively [Aboul-Enein, Serignese 1995]. See Plasma. Limit of detection, 2 μg/L [Spahn-Langguth *et al.* 1992].

Gastric Contents GC See Blood [Boniface 1991].

Brain GC-MS See Blood [Crifasi, Long 1997].

Liver GC See Blood [Boniface 1991].

GC-MS See Blood [Crifasi, Long 1997].

Disposition in the Body Readily absorbed after oral administration and extensively metabolised. <2% of a dose is excreted as unchanged drug in the urine in 24 h; this increases to ~8% if the urine is maintained at an acid pH.

Therapeutic Concentration

After a single dose of 10 mg trazodone to healthy volunteers the mean maximum plasma concentration ranged from 10.6–28.0 μg/L at 50–150 min [Krugers Dagneaux *et al.* 1992].

Three healthy volunteers were administered 20 mg oral racemic trazodone. Mean maximum plasma concentrations were 57.5 and 6.3 μg/L for the S-(-)- and R-(+)-isomers, respectively [Spahn-Langguth *et al.* 1992].

Following a single oral dose of 20 mg trazodone to 9 depressed patients, peak plasma concentrations of 64.5–190 μg/L were attained at 0.67–3.5 h. Volume of distribution and clearance were 1.1–5.7 L/kg and 6.4–40.6 mL/min/kg, respectively in these patients [Mallinger *et al.* 1986].

A single oral dose of 30 mg administered to 2 subjects produced a peak serum concentration of about 0.04 mg/L in 1 h. During chronic treatment of 42 patients with 10–30 mg daily, serum concentrations of 0.005–0.01 mg/L were found when measured 12 h after the last dose [Baselt *et al.* 1977b].

Toxicity Several cases of addiction to trazodone have been reported.

The following postmortem tissue concentrations were reported following the ingestion of 300 mg of trazodone: blood 3.7 mg/L, brain 1.0 μg/g, liver 7.3 μg/g, urine 25 mg/L; several other drugs were detected [Baselt *et al.* 1977a].

A 58-year-old was found dead. The following concentrations of trazodone were found: heart blood, 5.0 mg/L, iliac blood, 9.1 mg/L, liver, 21.0 mg/kg, and stomach contents, 227 mg. A 50-year-old suffered a seizure and died despite resuscitation attempts. Trazodone concentrations in the urine and blood were 50.8 and 1.7 mg/L, respectively [Boniface 1991].

A man who ingested 400 mg trazodone with suicidal intent had a blood trazodone concentration of 0.51 mg/L ~3 h later; another man, who was found dead 48 h after taking an unknown quantity of trazodone, had the following trazodone tissue concentrations: blood 0.7 mg/L, liver 1.9 mg/g, urine 238.0 mg/L [Iwersen, Schmoltd 1996].

A 41-year-old male survived after ingesting 4 g of trazodone in a suicide attempt. Approximately 8 h after ingestion of the overdose, the trazodone concentration in the blood was 19.9 mg/L and decreased to 1.14 mg/L on day 2, 0.028 mg/L on day 3, 0.006 mg/L on day 4 and 0.001 mg/L on day 8 [Pennings *et al.* 1997].

Half-life Plasma half-life, ~2 h.

Dose The equivalent of 10–30 mg of trazodone daily.

Trazodone

Antidepressant

C₁₉H₂₂ClN₅O = 371.9

CAS—19794-93-5

IUPAC Name 2-[3-[4-(3-Chlorophenyl)piperazin-1-yl]propyl]-[1,2,4]triazolo[4,3-a]pyridin-3-one

Chemical Properties Crystals. Mp 86° to 88°. Also reported as 96°. Soluble 1 in 50 of ethanol and methanol; freely soluble in acetone and benzene; slightly soluble in ether. Log P (octanol/water), 3.2. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Stable after freeze-thaw and long-term storage at -20°. Stock solutions were stable both at room temperature for 6 h and at -20° for 3 months [Mercolini *et al.* 2008].

Trazodone Hydrochloride

C₁₉H₂₂ClN₅O.HCl = 408.3

CAS—25332-39-2

Proprietary Names Azona; Deprax; Depyrel; Desirel; Desyrel; Molipaxin; Sideril; Thombtran; Trazodil; Trazolan; Trazone; Trazorel; Triticum; Trittico.

Chemical Properties White crystals. Mp 22°. Sparingly soluble in water, ethanol and methanol; soluble in chloroform; practically insoluble in common organic solvents.

Colour Tests Liebermann's reagent—violet (transient); Mandelin's test—grey—violet.

Thin-layer Chromatography System TA—R_f 0.63; system TB—R_f 0.10; system TC—R_f 0.58; system TE—R_f 0.66; system TAE—R_f 0.64; system TAF—R_f 0.61; system TAG—R_f 0.37 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; location under ultraviolet light—violet fluorescence.)

Gas Chromatography System GA—trazodone RI 3330, M (OH-acetyl-) RI 3380; system GB—trazodone RI 3562, M (mCPP) RI 1806, M (OH-acetyl-) RI 3640, M (desalkylacetyl-) RI 2261; system GM—trazodone not eluted.

High Performance Liquid Chromatography System HA—k 0.6; system HX—RI 378; system HY—RI 305; system HZ—RT 3.3 min; system HAA—RT 12.7 min.

Ultraviolet Spectrum Aqueous acid—246 (A₁¹ = 314a), 274, 310 nm. No alkaline shift.

Infrared Spectrum Principal peaks at wavenumbers 1705, 1595, 943, 1640, 742, 1272 cm⁻¹ (trazodone hydrochloride, KBr disk, see below).

Mass Spectrum Principal ions at *m/z* 205, 70, 231, 78, 135, 136, 42, 166.

Quantification

Plasma GC-MS Column: 3% OV-180/100 mesh Gas-Chrom Q (1 m × 3 mm i.d.). Carrier gas: N₂, 30 mL/min. Temperature: 270°. EI ionisation at 70 eV. Limit of detection, 50 µg/L [Caccia *et al.* 1981].

HPLC Column: reversed phase C₈ (150 × 4.6 mm i.d., 5 µm). Mobile phase: aqueous phosphate buffer containing 0.3% triethylamine (pH 3.5):acetonitrile (70:30), flow rate 1.2 mL/min. UV detection (λ = 255 nm). Retention time, 3.6 min. Limit of quantification, 10 µg/L, limit of detection, 4 µg/L [Micolini *et al.* 2008]. Column: Spherisorb S5 ODS (250 × 4.6 mm i.d.). Mobile phase: acetonitrile:0.05 mol/L sulfuric acid (18:1), flow rate 2 mL/min. UV detection (λ = 254 nm). Limit of detection, 20 µg/L [Ankier *et al.* 1981].

LC-MS Column: Inertsil C-8. Mobile phase: methanol: 10 µmol/L ammonium acetate (pH 5.0): acetonitrile (70:20:10), flow rate 0.10 mL/min. Limit of detection, 30 and 630 µg/L [Shinozuka *et al.* 2006].

Serum HPLC Column: C₁₈ (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol: 5 mmol/L acetic acid (pH 3.9, 20:80 to 70:30 over 4 min for 1 min), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 6.7 µg/L [Kirchherr, Kühn-Velten 2006]. Column: RP-Select B C₁₈ (250 cm × 4 mm i.d., 4 µm). Mobile phase: acetonitrile:buffer (30:70), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex} = 227 nm, λ_{em} = 300 nm). Limit of quantification, 76 µg/L, limit of detection, 5.3 mg/L [Waschglar *et al.* 2002].

Urine HPLC Column: C₁₈. Mobile phase: 0.2 mol/L SDS:8% 1-butanol (pH 3). Fluorimetric detection. Limit of quantification, 9.5 µg/L [Carda-Broch *et al.* 2007].

Brain GC-MS See Plasma [Caccia *et al.* 1981].

Disposition in the Body Trenbolone is rapidly and almost completely absorbed after oral administration. It is extensively metabolised by hydroxylation and oxidation. Approximately 75% of a dose is excreted in the urine as metabolites and 15% is eliminated in the faeces in 72 h. <1% of a dose is excreted in the urine as unchanged drug. The major urinary metabolites are a propionic acid derivative (3-oxo-1,2,4-triazolo[4,3-*a*]pyridine-2-propionic acid), *p*-hydroxytrenbolone and a dihydrodiol derivative and its glucuronide and sulfate conjugates, which account for ~35%, 20% and 15% of the urinary material respectively; an *N*-oxide has also been identified. In plasma, the major metabolite is 1-(3-chlorophenyl)piperazine (mCPP, active), but this accounts for <1% of a dose in the urine.

Therapeutic Concentration

After an oral dose of 50 mg to 13 subjects, peak plasma concentrations of 0.49–2.3 mg/L (mean, 1.1) were attained in 0.5–2.5 h [Ankier *et al.* 1981].

Following a single oral dose of 150 mg to 4 subjects, mean peak plasma concentrations of 2.05 mg/L trazodone and 0.01 mg/L 1-(3-chlorophenyl)piperazine were reported at ~2 h and 2–4 h, respectively [Caccia *et al.* 1982].

Following oral administration of 25 mg three times a day to 10 subjects, steady-state serum concentrations averaged 0.7 mg/L on the 12th day [Catanese *et al.* 1978].

Toxicity

In a fatality in which a woman was found drowned in a bath following the ingestion of ~2–4 g trazodone, the following postmortem concentrations were reported: blood 15 mg/L/mL, bile 45 mg/L, liver 57 µg/g and urine 2.5 mg/L [Demorest 1983].

Postmortem tissue concentrations of trazodone in 2 women, aged 53 and 48 years, were, respectively, as follows: blood 14.4 and 15.5 mg/L, brain 48.6 and 20.9 µg/g, liver 73.7 and 82.4 µg/g, lung 12.9 to 13.3 and 35.3 to 40.1 µg/g, fat 18.5 and 16.5 µg/g, kidneys 34.7 and 39.6 µg/g and heart 30.9 and 28.9 µg/g [Martin, Pounder 1992].

Trazodone was the primary cause of death in 3 subjects (2 suicides and 1 probable suicide), all of whom had blood concentrations >9 mg/L (9.06, 24.32 and 32.91 mg/L) [Goeringer *et al.* 2000].

Half-life Plasma half-life, ~4–7 h.

Protein Binding ~90%.

Dose Trazodone hydrochloride 100 to 300 mg daily; maximum 600 mg daily.

Trenbolone

Anabolic Steroid

C₁₈H₂₂O₂ = 270.4

CAS—10161-33-8

IUPAC Name (8S,13S,14S,17S)-17-Hydroxy-13-methyl-2,6,7,8,14,15,16,17-octahydro-1H-cyclopenta[*a*]phenanthren-3-one

Synonyms 4,9,11-Estratrien-17β-ol-3-one; (17β)-17-hydroxy-estra-4,9,11-trien-3-one; 17β-hydroxyestra-4,9,11-trien-3-one; RU-1697; β-TBOH; trienbolone; trienolone.

Proprietary Names *Parabolan*; *Regumate*.

Chemical Properties Crystals. Mp 183° to 186°.

Trenbolone Acetate

C₂₀H₂₄O₃ = 312.4

CAS—10161-34-9

Proprietary Names *Finajet*; *Finaplix*.

Chemical Properties Crystals. Mp 96° to 97°.

Trenbolone Hexahydrobenzylcarbonate

C₈H₁₃O₂ = 411

Proprietary Names *Hexabolan*; *Parabolan*.

Gas Chromatography System GAI—urinary metabolite: 17α-trenbolone RRT 0.943 (relative to 17α-methyl-5α-androstan-3β,17β-diol).

Gas Chromatography-Mass Spectrometry Column: HP1 methyl silicone (0.2 mm i.d., 0.33 µm). Temperature: 280°. Carrier gas: He, 0.9 mL/min. Retention index: trenbolone acetate, 2811 [Mills, Roberson 1993].

Column: HP1 methyl silicone (0.2 mm i.d., 0.33 µm). Temperature: 250°. Carrier gas: He, 0.9 mL/min. Retention index: 2775 [Mills, Roberson 1993].

High Performance Liquid Chromatography System HATa—trenbolone hexahydrobenzylcarbonate RRT 1.65 (relative to testosterone); system HATb—trenbolone acetate RRT 1.71 (relative to testosterone).

Ultraviolet Spectrum Alcohol—237, 340 nm (A_1^1 = between 92.0 and 97.6); ethanol—338 nm.

Infrared Spectrum Principal peaks at wavenumber 1636, 1568, 1225, 1100 cm^{-1} ; principal peaks at wavenumber 1652, 1739, 1244, 1023 cm^{-1} (trenbolone acetate).

Mass Spectrum Principal ions at m/z 270, 198, 252, 226, 141, 115, 155, 128; for acetate m/z 252, 312, 253, 237, 141, 198, 213, 270.

Quantification

Urine GC-MS Column: HP-1 capillary (17 m \times 0.2 mm i.d., 0.11 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 140° for 1 min to 180° at 40°/min to 240° at 3°/min to 300° at 40°/min for 3 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 6 $\mu\text{g/L}$, limit of detection, 3 $\mu\text{g/L}$ [Marques *et al.* 2007].

HPLC Column: Zorbax ODS (250 \times 4 mm i.d., 5 μm). Mobile phase: methanol-water (10:90): acetonitrile (85:15 to 63:37 over 10 min for 10 min, to 0:100 over 5 min), flow rate 1 mL/min. UV detection (λ = 340 nm). RT: 17 β -trenbolone, 33 min; 17 α -trenbolone, 35 min. Limit of detection not reported [Spranger, Metzler 1991].

LC-MS Column: Purospher Star RP-18e (15 \times 4 mm i.d., 3 μm). Mobile phase: 5 mmol/L ammonium acetate containing 0.1% acetic acid: acetonitrile (85:15 to

0:100 within 7 min), flow rate 500 $\mu\text{L/min}$. ESI, positive ion mode. Limit of detection, 1 $\mu\text{g/L}$ [Thevis *et al.* 2009] Column: C_{18} (250 \times 4.6 mm i.d., 4 μm). Mobile phase: 10 mmol/L ammonium acetate (pH 6.7): acetonitrile-methanol (50:50, 80:20 to 50:50 at 7 min to 20:80 at 8 min for 1 min), flow rate 1.0 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 1 $\mu\text{g/L}$, limit of detection, 0.03 $\mu\text{g/L}$ [Kosanam *et al.* 2007].

Bile LC-MS Column: LiChrosorb RP-18 (125 \times 4 mm i.d.). Mobile phase: acetonitrile:100 mmol/L ammonium acetate (45:55), flow rate 1 mL/min. Retention time: 4 min for 17 α -trenbolone. Limit of detection 0.5 ng/g [Hewitt *et al.* 1993].

Faeces HPLC See Bile. Limit of detection, 0.5 $\mu\text{g/L}$ [Hewitt *et al.* 1993].

Hair GC-MS Column: CP-Sil 5 CB (15 m \times 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 1 min to 300° at 20°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 10.3 min. Limit of quantification, 0.05 ng/mg, limit of detection, 0.005 ng/mg [Deng *et al.* 1999].

Other LC-MS Human Liver Microsomes. Column: Agilent Eclipse XDB C_{18} (50 \times 2.1 mm i.d., 5 μm). Mobile phase: 2.5 mmol/L ammonium acetate in 0.1% acetic acid: methanol (75:25 to 5:95 in 7 min for 3 min to 75:25 for 3 min), flow rate, 200 $\mu\text{L/min}$. ESI, positive ion mode. Limit of detection not reported [Kuورانne *et al.* 2008].

Disposition in the Body After administration, trenbolone undergoes metabolism to epitrenbolone and hydroxytrenbolone (possibly the main metabolites). These metabolites, mainly as the glucuronide form, have been identified in urine, along with a little trenbolone and estradiol, 17 α -estradiol, 17 β -estradiol and other polar metabolites in the unconjugated and sulfate forms.

Triamcinolone

Corticosteroid

$\text{C}_{21}\text{H}_{27}\text{FO}_6 = 394.4$

CAS—124-94-7

IUPAC Name (8S,9R,10S,11S,13S,14S,16R,17S)-9-Fluoro-11,16,17-trihydroxy-17-(2-hydroxyacetyl)-10,13-dimethyl-6,7,8,11,12,14,15,16-octahydrocyclopenta[a]phenanthren-3-one

Synonyms (11 β ,16 α)-9-Fluoro-11,16,17,21-tetrahydroxypregna-1,4-diene-3,20-dione; 9 α -fluoro-16 α -hydroxyprednisolone; flouxiprednisolonum.

Proprietary Names Aristocort; Atolone; Berlicort; Berlicort; Delphicort; Ipercortis; Kenacort; Ledercort; Sterocort; Triam-Oral; Triamscort; Volon.

Chemical Properties A white, slightly hygroscopic, crystalline powder. Mp about 269° to 271°. Soluble 1 in 500 of water and 1 in 240 of ethanol; slightly soluble in methanol; very slightly soluble in chloroform and ether. Log P (octanol/water), 1.2.

Triamcinolone Acetonide

$\text{C}_{24}\text{H}_{31}\text{FO}_6 = 434.5$

CAS—76-25-5

Proprietary Names Adcortyl; Aftab; Aftach; Albicort; Aristocort; Arutrin; Azmacort; Berlicort; Delphi(cort); Denkacort; Dermacort; Extracort; Facort; Generlog; Kanolone; Kela; Kemzid; Kenacort; Kenalog; Kenalone; Ledercort; Nasacor(t); Omcilon; Oracort; Orcilone; Sta-Cort A; Steronase; Triaderm; Triam; Triamamide; Tri-Anemul; Triderm; Trigon; Trilog; Trimacort; Volon A; Volonimat; Zamacort.

Chemical Properties A white or cream-coloured crystalline powder. Mp about 292° to 294°. Very slightly soluble in water; soluble 1 in 150 of ethanol, 1 in 11 of acetone and 1 in 40 of chloroform; sparingly soluble in dehydrated alcohol and methanol.

Triamcinolone Diacetate

$\text{C}_{25}\text{H}_{31}\text{FO}_8 = 478.5$

CAS—67-78-7

Proprietary Names Aristocort; Articulose LA; Delphicort; Delphimix; Kenacort; Ledercort; Proctosteroid; Tracilon; Triamolone; Trilone; Tristoject.

Chemical Properties A fine, white, crystalline powder. Practically insoluble in water; soluble 1 in 13 of ethanol, 1 in 80 of chloroform and 1 in 40 of methanol; slightly soluble in ether.

Triamcinolone Hexacetonide

$C_{30}H_{41}FO_7 = 532.6$
CAS—5611-51-8

Synonym Triamcinolone acetone 21-(3,3-dimethylbutyrate)

Proprietary Names *Aristospan*; *Hexatrione*; *Lederlon*; *Lederspan*.

Chemical Properties A white to cream-coloured powder. Mp 295° to 296°, with decomposition. Practically insoluble in water; soluble in chloroform; slightly soluble in methanol.

Colour Tests Naphthol-Sulfuric acid—green, yellow dichroism/yellow; sulfuric acid—orange.

Thin-layer Chromatography Triamcinolone: System TA— R_f 0.79; system TE— R_f 0.27; system TP— R_f 0.09; system TQ— R_f 0.00; system TR— R_f 0.00; system TS— R_f 0.00; system TAJ— R_f 0.14; system TAK— R_f 0.06; system TAL— R_f 0.65; system TAM— R_f 0.33. (DPST solution.) Triamcinolone acetone: System TP— R_f 0.32; system TQ— R_f 0.00; system TR— R_f 0.20; system TS— R_f 0.06 (DPST solution).

Gas Chromatography System GA—RI 2970 and RI 3107.

High Performance Liquid Chromatography Triamcinolone: System HX—RI 438; system HY—RI 312. Triamcinolone acetone: System HT— k 2.5.

Ultraviolet Spectrum Methanol—238 nm ($A_1^1=390a$).

Infrared Spectrum Principal peaks at wavenumbers 1663, 1057, 1618, 1609, 902, 1080 cm^{-1} (triamcinolone acetone, KBr disk).

Quantification

Blood HPLC UV detection. Limit of detection, 200 pg [Saito *et al.* 1979].

Plasma HPLC UV detection. Limit of detection, 0.6 $\mu g/L$ for triamcinolone acetone [Doppenschmitt *et al.* 1996].

Radioimmunoassay Limit of detection, <12.5 $\mu g/L$ [Loo, Jordan 1979].

Urine HPLC See Blood Saito *et al.* 1979].

Bronchoalveolar Lavage GC-MS Limit of detection, 6.0 ng/L for triamcinolone acetone [Hubbard *et al.* 2001].

Hair HPLC-MS Limit of detection, 0.03 to 0.17 $\mu g/g$ [Cirimele *et al.* 2000].

Note For a review of the pharmacokinetics of intranasal corticosteroids, see Szefer [2001].

Dose 4 to 48 mg daily.

Triamterene

Diuretic

$C_{12}H_{11}N_7 = 253.3$

CAS—396-01-0

IUPAC Name 6-Phenylpteridine-2,4,7-triamine

Synonyms NSC-77625; SKF-8542; triamterenum; triantereno.

Proprietary Names *Dyrenium*; *Dytac*; *Jatropur*. It is an ingredient of *Dyazide*, *Dytenzide*, *Dyotide*, *Frusene*, *Kalspare*, *Maxzide*, *Triamaxco* and *Triamco*.

Chemical Properties A yellow crystalline powder. Acidified solutions give a blue fluorescence. Mp 316°. Soluble 1 in 1000 of water, 1 in 3000 of ethanol, 1 in 4000 of chloroform and 1 in 30 of formic acid; soluble in dilute ammonia, dilute aqueous ammonium hydroxide and dimethylformamide; very slightly soluble in acetic acid and dilute mineral acids; practically insoluble in ether and dilute solutions of alkali hydroxides. pK_a 6.2. Log P (octanol/water), 0.98.

Colour Tests Liebermann's reagent—red-orange; Marquis test—yellow.

Thin-layer Chromatography System TA— R_f 0.51; system TB— R_f 0.01; system TC— R_f 0.08; system TE— R_f 0.30; system TL— R_f 0.04; system TAD— R_f 0.13; system TAE— R_f 0.50; system TAF— R_f 0.65; system TAJ— R_f 0.04; system TAK— R_f 0.00; system TAL— R_f 0.40 (location under ultraviolet light, blue fluorescence).

Gas Chromatography System GA—triamterene RI 2010, triamterene-Me₆ RI 2875; system GX—triamterene-Me₆ retention time 9.2 min.

High Performance Liquid Chromatography System HX—RI 298; system HY—RI 263; system HZ—retention time 2.3 min; system HAA—retention time 8.7 min; system HAX—retention time 6.7 min; system HAY—retention time 3.9 min.

Ultraviolet Spectrum Aqueous acid—250 ($A_1^1=634b$), 360 nm ($A_1^1=840a$); (0.1 mol/L hydrochloric acid)—228 ($A_1^1=1618$), 360 nm ($A_1^1=840$); aqueous alkali (0.1 mol/L sodium hydroxide)—232 ($A_1^1=1633$), 270 ($A_1^1=555a$), 370 nm ($A_1^1=741$); methanol—233 ($A_1^1=1570a$), 267 nm ($A_1^1=580a$).

Infrared Spectrum Principal peaks at wavenumbers 1574, 1610, 1584, 1536, 761, 822 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 253, 252, 43, 104, 254, 235, 77, 89.

Quantification

Blood HPLC Fluorescence detection. Limit of detection, 1 µg/L for triamterene, 2 µg/L for *p*-hydroxytriamterene sulfate [Sörgel *et al.* 1984].

Plasma HPLC For method of quantification for triamterene and *p*-hydroxytriamterene sulfate, see Sörgel *et al.* [1984]. UV detection. Limit of detection, 20 µg/L for triamterene and *p*-hydroxytriamterene [Yakatan, Cruz 1981].

Urine HPLC See Blood. Limit of detection, 40 µg/L for triamterene, 100 µg/L for *p*-hydroxytriamterene sulfate [Sörgel *et al.* 1984].

Disposition in the Body Rapidly but incompletely absorbed after oral administration and extensively metabolised. After oral administration, about 30 to 70% of a dose is excreted in the urine, mainly as the sulfate conjugate of *p*-hydroxytriamterene, with about 5 to 10% of a dose as unchanged drug; variable amounts are excreted in the bile. *p*-Hydroxytriamterene sulfate is an active metabolite. Triamterene crosses the placenta and it may be detected in breast milk.

Therapeutic Concentration

After single oral doses of 150 to 300 mg to 7 subjects, peak plasma-triamterene concentrations of 0.03 to 0.15 mg/L (mean, about 0.1) were attained in 1 to 2 h; peak plasma concentrations of *p*-hydroxytriamterene sulfate averaged about 1 mg/L at 2 to 4 h; both unchanged drug and the metabolite exhibited a second peak concentration several hours later, possibly due to enterohepatic circulation [Gundert-Remy *et al.* 1979].

Following a single oral dose of 100 mg to 6 subjects, peak plasma concentrations of 0.06 to 0.18 mg/L (mean, 0.13) of triamterene and 1.3 to 3.2 mg/L (mean, 1.8) of *p*-hydroxytriamterene sulfate were attained in about 1 to 2 h [Hasegawa *et al.* 1982].

Triamterene, 200 mg daily for 10 days, administered to 7 healthy subjects, produced an average plasma concentration during the dosage interval of 0.045 mg/L triamterene and 0.967 mg/L of hydroxytriamterene sulfate in healthy subjects; in 6 patients with cirrhosis and ascites, the respective levels were 0.586 and 0.747 mg/L (a 13-fold increase compared with healthy subjects) [Dao, Villeneuve 1988].

Toxicity The toxic low oral dose for a woman is 42 mg/kg body weight at 3 weekly intervals. It is moderately toxic by SC administration. May be poisonous by ingestion and IP routes.

Bioavailability 30 to 70%.

Half-life Plasma half-life, triamterene about 2 to 4 h, *p*-hydroxytriamterene sulfate, about 3 h; half-life derived from urinary excretion data, 6 to 12 h.

Distribution in Blood Plasma : whole blood ratio, triamterene 0.97, *p*-hydroxytriamterene sulfate, 1.7.

Protein Binding Triamterene about 45 to 70%, *p*-hydroxytriamterene sulfate about 90%.

Dose 150 to 250 mg daily; reduced to alternate days after 1 week.

Yakatan GJ, Cruz JE (1981). High-performance liquid chromatographic analysis of triamterene and *p*-hydroxytriamterene in plasma. *J Pharm Sci* 70: 949–951.

Chemical Properties A white or pale yellow crystalline powder. Mp 233° to 235°. Practically insoluble in water and ether; soluble 1 in 1000 of alcohol; 1 in 25 chloroform; 1 in 600 0.1 mol/L hydrochloric acid. Log *P* (octanol/water), 2.42. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Stock standard solutions in acetic acid were stable for at least 3 months when kept at 4°. Plasma samples were stable for 4 weeks when kept at 4° [Lee *et al.* 2006].

Thin-layer Chromatography System TA—*R_f* 0.60; system TB—*R_f* 0.01; system TC—*R_f* 0.40; system TD—*R_f* 0.05; system TE—*R_f* 0.44; system TF—*R_f* 0.02; system TL—*R_f* 0.16; system TAD—*R_f* 0.41; system TAE—*R_f* 0.68; system TAF—*R_f* 0.65.

Gas Chromatography System GA—triazolam RI 3080, M (α-OH-) RI 3000; system GB—triazolam RI 3219, M(α-OH-) not eluted, M (α-OH-)-TMS RI 3308.

Gas Chromatography-Mass Spectrometry Column: SGE BP1 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 65° for 1 min to 250° at 15°/min for 8 min to 300° at 10°/min for 2 min. EI ionisation, scan or SIM acquisition mode. Retention time: 23.2 min. Limit of quantification, 2.5–5 µg/L and 0.1–0.5 µg/L for scan and SIM modes, respectively [Borrey *et al.* 2001a].

High Performance Liquid Chromatography System HI—*k* 4.38; system HK—*k* 1.83; system HX—RI 476; system HY—RI 390; system HZ—RT 4.2 min; system HAA—RT 17.4 min; system HAF—RT 13.7 min; system HAL—RT 6.6 min; system HAM—not detected; system HAX—RT 6.4 min; system HAY—RT 6.7 min; system HAZ—*k* 1.07; system HBH—*k* 5.18; system HBI—*k* 1.13.

Ultraviolet Spectrum

Infrared Spectrum Principal peaks at wavenumbers 761, 842, 1618, 1003, 1310, 827 cm⁻¹ (KBr disk).

Triazolam

Benzodiazepine, Hypnotic

C₁₇H₁₂N₄ = 343.2

CAS—28911-01-5

IUPAC Name 8-Chloro-6-(2-chlorophenyl)-1-methyl-4*H*-1,2,4-triazolo[4,3-*a*]-1,4-benzodiazepine

Synonyms Clorazolam; U-33030.

Proprietary Names Apo-Triazo; Halcion; Hypam; Rilamir; Somese; Songar; Trilam; Trycam.

Mass Spectrum Principal ions at *m/z* 313, 238, 342, 315, 75, 344, 239, 137.

Quantification

Blood GC Column: TC-1 dimethyl silicone (15 m × 0.53 mm i.d., 1.5 µm) or TC-5 5% phenylmethyl silicone (15 m × 0.53 mm i.d., 1.5 µm) or TC-17 50% phenylmethyl silicone (15 m × 0.53 mm i.d., 1 µm). Carrier gas: N₂ or He, 15 kPa. Temperature programme: 150° for 2 min to 260° at 10°/min for TC-1 and TC-17 to 300° at 20°/min for the TC-5, for 27 and 10.5 min, respectively. FID. Limit of detection, 2 µg/L [Moriya, Hashimoto 2003]. Column: HP-1 (13 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 280° at 20°/min for 3 min. NPD. Limit of detection, 100 ng/g [Kudo *et al.* 1997a]. Column: HP5 cross-linked 5% phenylmethyl silicone (25 m × 0.32 mm i.d., 0.52 µm). Carrier gas: Ar:CH₄ (95:5), 3 mL/min. Temperature programme: 90° to 300° at 30°/min. Limit of detection, 0.002 mg/L [Steenoft, Worm 1993]. Column: Shimadzu CBP1 methyl silicone (10 m × 0.53 mm i.d., 1 µm). Carrier gas: He, 20 mL/min. Temperature programme: 220° to 260° at 5°/min. NPD. Limit of detection, 0.5 ng/g [Kudo *et al.* 1991].

GC-MS Column: HP-1 capillary (12 m × 0.2 mm i.d., 0.3 µm) Carrier gas: He, 10 psi. Temperature programme: 70° to 280° at 10°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection not reported [Rossi *et al.* 2009]. Column: DB-1 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 10.0 psi. Temperature programme: 140° to 225° at 25°/min to 245° at 12°/min to 300° at 30°/min. EI ionisation. Limit of quantification, 0.02 mg/L [Levine *et al.* 2002]. Column: CBJ1-S30-100 (30 m × 0.32 mm i.d., 1 µm). Temperature programme: 50° to 220° at 30°/min for 1 min to 280° at 5°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection not reported [Uemura, Komura 1995]. Column: Ultra-2 (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 40 cm/s. Temperature programme: 150° for 1 min to 280° at 30°/min for 12 min. NICI. Limit of quantification, 0.5 µg/L [Cairns *et al.* 1994]. Column: DB1 (15 m). Temperature programme: 185° to 300° at 11°/min. ECD. Retention time: 9.97 min. Limit of detection not reported [Joynt 1993]. See also Gjerd *et al.* [1992], Koves, Wells [1986].

HPLC Column: µBondapak C₁₈ (30 cm). Mobile phase: 0.05% acetic acid: acetonitrile (61:39), flow rate 1.5 mL/min. UV detection (λ=221 nm). Limit of detection not reported [Wong 1984].

Plasma GC Column: Ultra 2 5% phenylmethyl silicone (25 m × 0.32 mm i.d.). Carrier gas: He, 2.1 mL/min. Temperature programme: 210° to 285° at 2.5°/min. NPD and ECD. Limit of quantification, 1 µg/L [Gaillard *et al.* 1993].

GC-MS Column: fused silica (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He with auxiliary gas of 5% Ar in CH₄, 0.6 and 30 mL/min, respectively. Temperature programme: 200° for 1 min, to 235° at 35°/min to 265° at 5°/min for 1 min. IS: flunitrazepam. ECD. Retention time: triazolam, 8.66 min; IS, 4.65 min. Limit of detection, 0.02 µg/L [Edeki *et al.* 1992]. Column: DB-17 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 30 psi. Temperature programme: 40° for 1 min to 250° at 30°/min to 280° at 10°/min to 300° at 5°/min for 8 min. EI ionisation at 70 eV. Retention time: 21.2 min. Limit of quantification, 0.5 µg/L [Karl *et al.* 1997]. Column: OV-1701 (15 m × 0.32 mm i.d., 0.32 µm). Carrier gas: H₂, 4 mL/min. Temperature programme: 80° to 260° at 30°/min. ECD. Retention time: 15 min. Limit of detection, 0.5 µg/L [Baktir *et al.* 1985]. Column: WSCOT (25 m × 0.32 mm i.d.). Carrier gas: He, 0.8 bar. Temperature programme: 150° to 300° at 2/min. ECD. Limit of detection, 0.1–0.2 µg/L [Coassolo *et al.* 1983]. Column: 1% OV-17 on 80/100 Chromosorb W HP (1.83 m × 2 mm i.d.). Carrier gas: He, 50 mL/min. Temperature: 290°. ECD. Retention time: 4.1 min. Limit of detection, 0.25 µg/L [Greenblatt *et al.* 1981]. See also Jochemsen, Breimer [1981].

HPLC Column: Develosil C18-5 and C8-5 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.5% monobasic potassium phosphate (pH 4.5): acetonitrile (65:35), flow rate 1.0 mL/min. UV detection (λ=230 nm). Retention time: 19 min. Limit of detection, 0.5 µg/L [Yasui *et al.* 1997]. Column: µBondapak C₁₈ (300 × 3.9 mm i.d.). Mobile phase: methanol: 10 mmol/L phosphate buffer (pH 6.0, 50:50), flow rate 1.0 mL/min. UV detection (λ=220 nm). Limit of detection not reported [Kinirons *et al.* 1996]. Column: Nova Pak C₁₈ (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile: methanol: 6 mmol/L phosphate buffer (23:13:64), flow rate 1.3 mL/min. UV detection (λ=242 nm). Limit of detection, 3.0 µg/L [Boukhabza *et al.* 1991].

LC-MS Column: C₁₈ (50 × 2.1 mm i.d., 3 µm). Mobile phase: acetonitrile: water: formic acid (35:65:0.2), flow rate 0.25 mL/min. ESI, CID, MRM acquisition mode. Limit of quantification, 0.05 µg/L [Pan *et al.* 2008]. Column: Shodex MSPak GF-310 4B (50 × 4.6 mm i.d., 6 µm). Mobile phase: 10 mmol/L ammonium acetate (pH 3.56) with 0.1% formic acid: acetonitrile (100:0 for 5 min to 40:60 for 30 min to 30:70 for 5 min), flow rate 0.2 mL/min. ESI, positive ion mode, SRM acquisition mode. Limit of quantification, 0.25 µg/L, limit of detection, 0.1 µg/L [Kratzsch *et al.* 2004; Lee *et al.* 2006]. Column: ODS-HG-5 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 50 mmol/L ammonium acetate: methanol or acetonitrile (50:50 to 0:100 at 15 min. Positive ion mode. Retention time, 7.9 min. Limit of quantification, 20 ng/L [Senda *et al.* 1995].

Serum GC-MS Column: OV-17 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 40 mL/min. Temperature programme: 110° for 1 min to 300° at 10°/min for 5 min. ECD. Limit of detection, 0.5 µg/L [Nishioka 1996].

HPLC [Tanaka *et al.* 1996]. UV detection. Limit of detection, 0.001 µg [Adams *et al.* 1980].

GC-MS Column: DB-5 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 50 mL/min. Temperature programme: 150° for 1 min to 300° at 10°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 0.5 ng/g [Inoue *et al.* 1997].

Myocardium GC See Brain [Moriya, Hashimoto 2003].

Nail LC-MS See Hair [Irving, Dickson 2007].

Skeletal Remains GC-MS Column: HP-1 (13 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 2 min to 300° at 20°/min for 2 min. NICI. Limit of detection, 0.2 ng/g [Kudo *et al.* 1997b].

Spleen GC See Blood [Kudo *et al.* 1997a].

Disposition in the Body Triazolam is rapidly and almost completely absorbed after oral administration. It is metabolised mainly by hydroxylation. The major metabolite, 1-hydroxymethyltriazolam, has a hypnotic potency approximately equivalent to that of triazolam. Other metabolites include 4-hydroxytriazolam, 1-hydroxymethyl-4-hydroxytriazolam and three dichlorotriazolylbenzophenone derivatives. CYP3A4, and not CYP2C19, is involved in the metabolism of triazolam [Yasui *et al.* 1997]. Approximately 80% of a dose is excreted in the urine in 48 h mainly as the unconjugated metabolite (only a small amount as the unchanged drug) and ~7% is eliminated in the faeces in 72 h.

Therapeutic Concentration

Following oral administration of 0.88 mg [¹⁴C]-labelled triazolam to six subjects, peak plasma concentrations of 6 to 17 µg/L (mean 9 µg/L) triazolam were attained in 0.75–3 h; peak plasma concentrations of the

glucuronide conjugates of the 1-hydroxymethyl and 4-hydroxy metabolites of 3–10 µg/L (mean 6) and 2–9 µg/L (mean 6 µg/L) were attained in 0.75–2.5 h and 1.5–5 h, respectively [Eberts *et al.* 1981].

Six male volunteers were administered 0.125, 0.250 or 0.375 mg triazolam. The mean peak plasma concentrations observed were 2.2, 4.3 and 5.0 µg/L, respectively, for the 3 doses and the times to reach these concentrations were 0.7, 0.6 and 0.8 h, respectively [Edeki *et al.* 1992].

Nine healthy children, aged 6 to 9 years were given oral doses of 0.025 mg/kg triazolam before dental treatment; the total dose administered to each child ranged from 0.5 to 0.9 mg (median dose 0.75 mg). The mean peak plasma concentration was 8.5 µg/L (range, 4.7–13.7 µg/L), which was reached in 74 min (range, 45–128 min) [Karl *et al.* 1997].

A mean peak plasma triazolam concentration of 4.9 µg/L (SD, 2.0) was attained in 75 min in 9 healthy children given 0.25 or 0.375 mg of sublingual triazolam before dental treatment [Tweedy *et al.* 2001].

Three healthy Chinese volunteers were administered 0.25 mg triazolam. The mean maximum plasma concentration was 1.4 µg/L, reached at 1.2 h [Pan *et al.* 2008].

Toxicity Manifestations of overdose, including somnolence, confusion, impaired coordination, slurred speech and even coma, may occur with doses of 2 mg (four times the recommended therapeutic dose). Seizures, respiratory depression and even death have also been reported. The lowest triazolam blood concentration that has been associated with death is 7 µg/L in whole blood. Ethanol at a concentration of 2300 mg/L was also detected in the blood of this individual [Uemura, Komura 1995].

A 76-year-old woman was found dead in her kitchen. The concentration of triazolam in her blood and gastric contents was 1100 and 1300 µg/L, respectively [Rossi *et al.* 2009].

A 77-year-old woman who was found dead in her bathtub (her head was above the water line and an empty bottle of triazolam was discovered in the bin) was revealed to have a heart blood triazolam concentration of 120 µg/L; the cause of death was ruled to be triazolam intoxication and the manner of death was suicide [Levine *et al.* 2002].

A 57-year-old man was found dead. Blood triazolam concentrations decreased in the order inferior vena cava, right cardiac chambers, pulmonary arteries, pulmonary veins, left cardiac chambers/aorta, right femoral vein [Moriya, Hashimoto 2003].

Of 6 fatal poisonings by triazolam alone or in combination with ethanol, in 1 case where only triazolam was detected, the blood concentration was 110 µg/L. Because of putrefaction, blood was not available for analysis in the other case involving only triazolam. In the 4 cases also involving ethanol (blood concentration 1100–2020 mg/L), the triazolam concentration was 40–220 µg/L [Steentoft, Worm 1993].

A 39-year-old man was found dead in bed next to empty packages each providing 40 Halcion tablets (25 mg each). The triazolam concentration was 104.4, 153.1 and 398.8 ng/g in skeletal muscle, kidney and liver, respectively [Kudo *et al.* 1991].

Three individuals, aged 76, 59 and 75 years, were all found dead in bed. Blood triazolam concentrations were 16, 20 and 26 µg/L, respectively [Bal *et al.* 1989].

A 38-year-old drug addict who was being treated with methadone was found dead at home. At the scene were syringes containing a liquid later identified to be blood with traces of triazolam and a number of bottles containing Halcion (triazolam). Toxicological analysis of blood, bile, urine and stomach contents showed concentrations of triazolam (blood, 15 µg/L; urine, traces); morphine (blood, 0.12 mg/L; bile, total of 0.0037 mg; urine, traces) and codeine (blood, 0.030 µg/L; urine, traces). The blood drug concentrations were also found to be at therapeutic concentrations only. The cause of death was determined as the combined adverse effects of triazolam and morphine. This is the first case reported where triazolam was injected rather than taken orally [Kammie Hon *et al.* 1988].

Half-life Plasma half-life, triazolam 1.5–3 h, 1-hydroxymethyltriazolam ~4 h.

Volume of Distribution ~1–2 L/kg, also quoted as 65 L (mean).

Clearance Plasma clearance, ~10 mL/min/kg, also quoted as 300 mL/min (mean).

Protein Binding ~89%.

Note For a review of the pharmacokinetics of triazolam see Garzone, Kroboth [1989], Gupta *et al.* [1990], Klett [1992] and Pakes *et al.* [1981].

Triazophos

Acaricide, Insecticide

$C_{12}H_{16}N_3O_3PS = 313.3$

CAS—24017-47-8

IUPAC Name Dethoxy-[(1-phenyl-1,2,4-triazol-3-yl)oxy]-sulfanylidene- λ^5 -phosphane

Synonyms HOE 2960; HOE 2960 OJ; posphorothioic acid *O,O*-diethyl-*O*-(1-phenyl-1*H*-1,2,4-triazol-3-yl)-ester; triazofos.

Proprietary Name Hostathion

Chemical Properties A yellowish to light brown oil. Mp 2° to 5° (technical); 0.5°. Soluble in water (39 mg/L at 20°), *n*-hexane (0.7 g/100 mL at 25°), toluene (30 g/100 mL at 25°), ethyl acetate (30 g/100 mL at 25°), acetone (30 g/100 mL at 25°) and ethanol (30 g/100 mL at 25°). Log *P* (octanol/water), 3.34.

Thin-layer Chromatography System TX— R_f 0.21; system TY— R_f 0.38.

Gas Chromatography System GA—RI 2258.

Ultraviolet Spectrum Principal peak at 242 nm.

Mass Spectrum Principal ions at *m/z* 161, 162, 172, 257, 285, 77, 208, 177.

Disposition in the Body Triazophos is absorbed through the skin, respiratory tract and gastrointestinal tract. It acts on the central nervous system.

Toxicity The allowed daily intake is 0.001 mg/kg bodyweight and the highest dose to show no toxic effect is 0.0125 mg/kg.

Tributyl Phosphate

Plasticiser

$C_{12}H_{27}O_4P = 266.3$

CAS—126-73-8

IUPAC Name Tributyl phosphate

Synonyms BP; tributylphosphate; tributoxyphosphine oxide.

Proprietary Names Celluphos 4; Disflammol TB.

Chemical Properties A colourless to pale yellow liquid. Mp −79° to 80°. Bp 289°. Slightly soluble in water (<1 mg/L at 20.5°); soluble in DMSO, 95% ethanol and acetone (≥100 g/L at 20.5°), ether and benzene. Log *P* (octanol/water), 4.00.

Gas Chromatography System GA—RI 1690.

Infrared Spectrum Principal peaks at wavenumbers 1031, 1293, 907 cm^{-1} .

Mass Spectrum Principal ions at *m/z* 99, 156, 41, 29, 57, 211, 125, 137.

Disposition in the Body Tributyl phosphate is absorbed through the skin and after ingestion. During metabolism, oxidation and dealkylation occur to produce dibutylhydrogen phosphate, butyldihydrogen phosphate and butyl-bis(3-hydroxybutyl)phosphate. Excretion occurs mainly within the first 48 h in urine mostly but also in faeces and via exhalation.

Toxicity Tributyl phosphate is highly toxic via IV and IP routes and moderately toxic via oral administration.

Trichlorfon

Insecticide, Anthelmintic

$C_4H_8Cl_3O_4P = 257.4$

CAS—52-68-6

IUPAC Name 2,2,2-Trichloro-1-dimethoxyphosphorylethanol

Synonyms BayerL13/59; chlorofos; DEP; DETE; *O,O*-dimethyl-2,2,2-trichloro-1-hydroxyethylphosphonate; dipherex; foschlor; metrifonate; metrifonatum; metrifonate; TCF; trichlorofon; trichlorophon.

Proprietary Names Anthon; Bilarcil; Bovinox; Briten; Chlorofos; Chlorophos; Ciclosom; Combot; Dipterex; Ditrifon; Dylox; Dyrex; Leivasom; Neguvon; Proxol; Trinex; Vermicide; Masoten; Promem.

Chemical Properties A white crystalline powder. Mp 75°. Very soluble in water (15.4 g/100 mL at 20°); soluble in dichloromethane, 2-propanol, diethyl ether (17 g/100 mL at 20°), alcohol, acetone, chloroform (75 g/100 mL at 20°), benzene (15.2 g/100 mL at 20°) and toluene; very slightly soluble in *n*-hexane (0.08 g/100 mL at 20°) and pentane. Log *P* (octanol/water), 0.52.

Thin-layer Chromatography System TE— R_f 0.61; system TX— R_f 0.07; system TY— R_f 0.02; system TZ— R_f 0.15; system TAA— R_f 0.05; system TAB— R_f 0.02; system TAC— R_f 0.01; system TAE— R_f 0.90.

Gas Chromatography System GA—trichlorfon RI 1438; trichlorfon-Me RI 1395; system GK—RRT 0.27 (relative to caffeine).

High Performance Liquid Chromatography System HY—RI 738.

Infrared Spectrum Principal peaks at wavenumbers 1109, 1154, 854, 978, 1323 cm^{-1} .

Mass Spectrum Principal ions at m/z 109, 79, 110, 145, 139, 47, 15, 112.

Quantification

Blood GC ECD. Limit of quantification, 0.01 mg/L [Heinig *et al.* 2000]. In serum: limit of detection 2.5 $\mu\text{g/L}$, FTD [Ameno *et al.* 1989].

GC-MS Limit of quantification, 0.001 mg/L for the metabolite dichlorvos (DDVP) [Heinig *et al.* 2000].

Plasma HPLC Limit of quantification, 1 mg/L for trichlorfon, 0.04 mg/L for the metabolite DDVP [Unni *et al.* 1992].

Serum GC See Blood [Ameno *et al.* 1989].

GC-MS Limit of detection, 0.06 mg/L for the metabolite, dimethylphosphate (DMP) [Tarbah *et al.* 1998].

Urine GC See Blood [Heinig *et al.* 2000].

GC-MS See Blood [Heinig *et al.* 2000].

Disposition in the Body Trichlorfon is rapidly absorbed after oral administration and some of the dose is converted to dichlorvos (DDVP), which is the active moiety. Another metabolite observed is dimethylphosphate (DMP) as well as dimethylphosphoric acid, phosphoric acid, desmethyl-dichlorvos and monomethyl-phosphoric acid. It is excreted via the kidneys mainly as glucuronides. Approximately 70% of a dose is recovered in urine and also a small amount in faeces. Trichlorfon is readily absorbed through the skin and absorption, distribution and excretion are quick. It is distributed to the main organs with the highest concentrations observed in the liver, kidney and lungs.

Blood Concentration

Six healthy male volunteers were administered with a single oral dose of 7.5 mg/kg trichlorfon. Trichlorfon was quickly absorbed and peak plasma concentrations were observed 0.7 to 1 h after administration at levels of 50.5 $\mu\text{mol/L}$. DDVP concentrations were ~1% of that for trichlorfon [Abdi, Villen 1991].

Toxicity Moderately toxic by ingestion and dermal absorption. The allowed daily intake is 0.01 mg/kg.

A 76-year-old man committed suicide by ingesting 50 mL of Dipterex and died after 8 h. An autopsy revealed that his trichlorfon blood concentration was 215 $\mu\text{g/g}$ and his gastric lavage liquid sample contained 15 mg/g of the pesticide. These samples were taken 1 h after admission [Yashiki *et al.* 1988].

A 70-year-old woman died from acute trichlorfon poisoning after ingesting 50% emulsifiable concentrate. Postmortem toxicology showed a blood concentration of 310 $\mu\text{g/g}$, liver 487 $\mu\text{g/g}$, brain 465 $\mu\text{g/g}$, kidney 416 $\mu\text{g/g}$, urine 2240 $\mu\text{g/g}$ and a total of 7.2 g in her stomach contents [Yashiki *et al.* 1982].

Half-life The mean half-life is 2.07 h for healthy volunteers.

Clearance The mean clearance, for healthy males, is 0.34 L/h/kg.

Dose (As an anthelmintic agent), 7.5 to 10 mg/kg bodyweight every two weeks for three doses.

Trichlormethiazide

Diuretic

$\text{C}_8\text{H}_8\text{Cl}_3\text{N}_3\text{O}_4\text{S}_2 = 380.7$

CAS—133-67-5

IUPAC Name 6-Chloro-3-(dichloromethyl)-1,1-dioxo-3,4-dihydro-2H-benzo[e][1,2,4]thiadiazine-7-sulfonamide

Synonyms 6-Chloro-3-(dichloromethyl)-3,4-dihydro-2H-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide; hydrotrichlorothiazide.

Proprietary Names *Diurese*; *Metahydrin*; *Naqua*. It is an ingredient of *Esmalorid*, *Metatensin* and *Rulun*.

Chemical Properties A white crystalline powder. Mp about 270°, with decomposition. Very slightly soluble in water, chloroform and ether; soluble 1 in 48 of ethanol, 1 in 17 of methanol, 1 in about 9 of dioxan and 1 in about 4 of dimethylformamide; freely soluble in acetone. pK_a 8.6. Log *P* (octanol/water) 0.6.

Colour Test Sulfuric acid—yellow.

Thin-layer Chromatography System TA— R_f 0.80; system TD— R_f 0.15; system TE— R_f 0.14; system TF— R_f 0.60; system TAD— R_f 0.23; system TAE— R_f 0.88; system TAJ— R_f 0.24; system TAK— R_f 0.05; system TAL— R_f 0.61 (acidified potassium permanganate solution, positive).

Gas Chromatography System GA—RI 2810; system GX—retention time 10.7 min (both for trichlormethiazide- ME_4).

High Performance Liquid Chromatography System HN— k 3.10; system HY—RI 341; system HAA—retention time 14.9 min.

Ultraviolet Spectrum Principal peaks at 225, 267, 314 nm.

Infrared Spectrum Principal peaks at wavenumbers 1158, 1177, 1597, 772, 1073, 1509 cm^{-1} (KBr disk).

T

Mass Spectrum Principal ions at m/z 296, 298, 279, 205, 36, 64, 117, 62.

Quantification

Plasma HPLC UV detection. Limit of detection, 10 µg/L [Meyer, Hwang 1981].

Urine HPLC See Plasma [Meyer and Hwang 1981].

Disposition in the Body Readily absorbed after oral administration. About 70% of a dose is excreted in the urine unchanged in 48 h, mostly in the first 8 h.

Therapeutic Concentration

Following a single oral dose of 4 mg to 7 subjects, peak plasma concentrations of 0.027 to 0.067 mg/L (mean, 0.04) were attained in 1 to 3.5 h (mean, 2) [Sketris *et al.* 1981].

Half-life Plasma half-life, about 1 to 4 h (mean, 2), increased in renal impairment.

Dose Usually 2 to 4 mg daily; initial doses of 4 to 8 mg daily may be given.

Sketris IS *et al.* (1981). The pharmacokinetics of trichloromethiazide in hypertensive patients with normal and compromised renal function. *Eur J Clin Pharmacol* 20: 453-457.

Trichloroethane

Solvent

$\text{CCl}_3\text{CH}_3 = 133.4$

CAS—71-55-6

IUPAC Name 1,1,1-Trichloroethane

Synonyms Chloroethene; methylchloroform; α -trichloroethane.

Proprietary Name Zoff

Chemical Properties A colourless non-flammable liquid. Mp -32.5° . Bp 74° . Practically insoluble in water; miscible with ethanol, methanol, acetone, benzene, ether and chloroform. Log P (octanol/water) 2.5.

Colour Test Fujiwara test—red.

Gas Chromatography System GA—RI 634; system GI—retention time 8.2 min.

Mass Spectrum Principal ions at m/z 97, 99, 61, 117, 119, 63, 101, 62.

Quantification

Blood GC Headspace analysis and FID. For method, see Caplan *et al.* [1976].

Urine GC FID. For method, see Ghittori *et al.* [1987].

Bile GC See Blood [Caplan *et al.* 1976].

Tissues GC See Blood [Caplan *et al.* 1976].

Breath GC—MS Sensitivity, in ppb range [Thomas *et al.* 1991].

Disposition in the Body Rapidly absorbed from the gastrointestinal tract and the lungs; poorly absorbed through the skin. It is metabolised by oxidation and conjugation; only a small proportion of an absorbed dose is excreted in the urine as trichloroethanol glucuronide (urochloral acid) and trichloroacetic acid. About 60 to 80% of a dose is excreted unchanged in expired air in one week.

Toxicity The estimated minimum lethal dose by ingestion or inhalation is 5 mL and the maximum permissible atmospheric concentration is 350 ppm. Exposure to air concentrations of more than 5000 ppm may cause unconsciousness within a short time. Fatalities have been associated with blood concentrations >15 mg/L.

The following postmortem tissue concentrations were reported in a fatality involving the accidental inhalation of trichloroethane: blood 18 mg/L, brain 80 µg/g, liver 80 µg/g, lungs 31 µg/g, urine 0.9 mg/L [Franc 1983].

A postmortem blood tetrachloroethane concentration of 1.7 mg/L was found following fatal cerebral oedema in a 15-year-old boy who had been sniffing typewriter correction fluid [D'Costa, Gunasekera 1990].

There was a broad correlation between blood tetrachloroethane concentration and severity of poisoning in 48 patients referred to a poisons unit (plus data from 18 other deaths); concentrations ranged from 0.1 to 60 mg/L [Meredith *et al.* 1989].

Half-life Blood half-life, about 10 to 12 h.

Caplan YH *et al.* (1976). 1,1,1-trichloroethane: report of a fatal intoxication. *Clin Toxicol* 9: 69-74.

Trichloroethanol

Hypnotic

$\text{C}_2\text{H}_3\text{Cl}_3\text{O} = 149.4$

CAS—115-20-8

IUPAC Name 2,2,2-Trichloroethanol

Synonym 2,2,2-Trichloroethyl alcohol

Chemical Properties A hygroscopic liquid or crystals. Mp 18° . Bp 151° to 153° . Soluble 1 in about 12 of water; miscible with ethanol and ether. pK_a 12.2 (25°). Log P (octanol/water) 1.4.

Colour Test Fujiwara test—yellow.

Gas Chromatography System GA—RI 857; system GI—retention time 25.5 min.

Mass Spectrum Principal ions at m/z 31, 49, 77, 113, 115, 82, 51, 117.

Quantification See under Chloral Hydrate.

Disposition in the Body Trichloroethanol is a metabolite of chloral hydrate, trichloroethane, trichloroethylene and triclorofos; it has hypnotic activity. It is further metabolised by conjugation with glucuronic acid to form urochloral acid and by oxidation to trichloroacetic acid.

Toxicity See under Chloral Hydrate.

Half-life Plasma half-life, about 8 h.

Volume of Distribution About 0.6 L/kg.

Distribution in Blood Plasma : whole blood ratio, about 0.9.

Protein Binding About 35%.

Trichloroethylene

Anaesthetic (General), Solvent

$\text{C}_2\text{HCl}_3 = 131.4$

CAS—79-01-6

IUPAC Name 1,1,2-Trichloroethene

Synonyms Trichloroethylene; trichloroethene.

Proprietary Name Trilene.

Chemical Properties A clear, colourless or pale blue, mobile, non-flammable liquid. It decomposes in light in the presence of moisture with the formation of hydrochloric acid. Relative density 1.464 to 1.470. Bp 87° . Trichloroethylene (B.P.) contains thymol 0.01% w/w as a preservative and may contain not more than 0.001% w/w of a suitable blue colouring matter to distinguish it from chloroform. Practically insoluble in water; miscible with dehydrated alcohol, chloroform and ether. Log P (octanol/water) 2.4.

Colour Test Fujiwara test—red.

Gas Chromatography System GA—RI 710; system GI—retention time 14.8 min.

Ultraviolet Spectrum

Mass Spectrum Principal ions at m/z 95, 130, 132, 60, 97, 35, 134, 47; trichloroacetic acid 44, 83, 85, 36, 28.

**Quantification**

Blood GC ECD using headspace analysis. Trichloroethanol and trichloroacetic acid. Limit of detection, 500 $\mu\text{g/L}$ for trichloroethanol [Breimer *et al.* 1974]. FID using headspace analysis. For method, see Prior [1972].

Urine GC Headspace analysis. Trichloroethanol and trichloroacetic acid. Limit of detection, 5 $\mu\text{g/L}$ for trichloroethanol [Ohara *et al.* 1991]. See Blood [Breimer *et al.* 1974].

GC-MS Headspace analysis. For a method for the quantification of trichloroethylene, see Imbriani *et al.* [2001].

HPLC Limit of detection, 0.5 μg for trichloroacetic acid [Ogata, Yamazaki 1979].

Disposition in the Body Rapidly absorbed from the lungs; about 50 to 65% of an inhaled dose is retained. Absorbed from the gastrointestinal tract and through the skin. It is highly soluble in lipid-rich tissues, from which it is slowly released. Cloral hydrate is a transient metabolite which is further metabolised by reduction to trichloroethanol and oxidation to trichloroacetic acid. Trichloroethanol is mainly excreted as its glucuronide conjugate (urochloral acid). Monochloroacetic acid is a minor metabolite. About 45% of an absorbed dose is excreted as urochloral acid and about 30% as trichloroacetic acid in the urine in 3 weeks; small amounts are eliminated in the faeces. About 16% is excreted unchanged in expired air.

Therapeutic Concentration In blood, for anaesthesia, usually in the range 26 to 82 mg/L .

During anaesthesia, exposure to an induction level of 1% of trichloroethylene for 30 min to 20 patients, produced blood concentrations of 34 to 90 mg/L (mean, 65) [Prior 1972].

Toxicity The estimated minimum lethal dose by ingestion or inhalation is 5 mL and the maximum permissible atmospheric concentration is 100 ppm.

A man aged 56 years was found dead after exposure to trichloroethylene fumes. The following postmortem concentrations of trichloroethylene were reported: blood about 90 mg/L , brain about 270 $\mu\text{g/g}$, lung about 40 $\mu\text{g/g}$ [Alha *et al.* 1974].

In 19 cases of fatal trichloroethylene poisoning, the following postmortem concentrations were reported: blood 1 to 41 mg/mL (mean, 14, 15 cases), brain 4 to 74 $\mu\text{g/g}$ (mean, 31, 5 cases), kidney 4 to 140 $\mu\text{g/g}$ (mean, 30, 8 cases), liver 1 to 250 $\mu\text{g/g}$ (mean, 64, 9 cases), lung 1 to 15 $\mu\text{g/g}$ (mean, 7, 6 cases), urine a trace to 91 mg/L (mean, 35, 5 cases) [Bonnichsen, Maehly 1966].

A 17-year-old male ingested about 70 mL of trichloroethylene in a suicide attempt. The highest blood concentration of trichloroethylene (4.05 mg/L) was reached at 13 h after ingestion [Brüning *et al.* 1998].

Half-life About 30 to 38 h.

Dose To produce light anaesthesia, 0.5 to 2% of the vapour by inhalation.

Trichlorofluoromethane

Aerosol Propellant, Refrigerant

$\text{CCl}_3\text{F} = 137.4$

CAS—75-69-4

IUPAC Name Trichloro(fluoro)methane

Synonyms Fluorocarbon 11; fluorotrichloromethane; propellant 11; refrigerant 11; trichloromonofluoromethane.

Proprietary Name It was formerly an ingredient of *PR Spray*.

Chemical Properties A clear, colourless, non-flammable volatile liquid. Bp about 24°. In the liquid state it is practically immiscible with water but miscible with dehydrated alcohol, ether and other organic solvents. Log *P* (octanol/water) 2.5.

Gas Chromatography System GA—RI 484; system GI—retention time 3.0 min.

Mass Spectrum Principal ions at m/z 101, 103, 105, 66, 47, 35, 31, 82.

**Disposition in the Body****Toxicity**

A 33-year-old man, working in an expanded polyurethane factory where trichlorofluoromethane was used as a foaming agent, was found dead on the floor in a 4 m² room. Postmortem examination revealed the following concentrations: blood, 62.8 mg/L ; brain 108.9 mg/kg ; lung, 149.1 mg/kg ; liver 74.1 mg/kg and <0.1 mg/L in urine [Groppi *et al.* 1994].

Groppi A *et al.* (1994). A fatal case of trichlorofluoromethane (Freon 11) poisoning. Tissue distribution study by gas chromatography-mass spectrometry. *J Forensic Sci* 39: 871–876.

Trichlorophenoxyacetic Acid

Herbicide

$\text{C}_8\text{H}_5\text{Cl}_3\text{O}_3 = 255.5$

CAS—93-76-5;

IUPAC Name (2,4,5-Trichlorophenoxy)acetic acid

Synonym 2,4,5-T

Proprietary Names *Boots Nettle Killer; Marks Brushwood Killer; Phortox; Silvapron T; Triozone 50.* It is an ingredient of *Econal, Nettle Ban, Spontox and Stancide BWK 75.*

Chemical Properties A white crystalline solid. Mp 153°. Very slightly soluble in water; soluble in ethanol, acetone and ether. pK_a 2.8 (25°). Log *P* (octanol/water), 3.3.

Colour Test Liebermann's reagent—pink→brown.

Thin-layer Chromatography System TAB— R_f 0.04; system TAC— R_f 0.02.

Gas Chromatography System GA—2,4,5-T RI 1850, 2,4,5-T-methyl ester RI 1750, 2,4,5-T-isobutyl ester RI 2280, 2,4,5-T-isopropyl ester RI 1825, 2,4,5-T-isooctyl ester RI 2320, M (trichlorophenol) RI 1440; system GK—2,4,5-T-methyl ester RRT 0.80; 2,4,5-T-isooctyl ester RRT 1.24 and RRT 1.31 (both relative to caffeine).

Ultraviolet Spectrum Principal peaks at 206, 236, 289 nm.

Mass Spectrum Principal ions at m/z 233, 45, 42, 59, 179, 146, 109, 235 (methyl ester); 43, 57, 41, 55, 71, 69, 56, 70 (isooctyl ester).

Triclobisonium Chloride

Antimicrobial, Antiseptic

$C_{36}H_{74}Cl_2N_2 = 605.9$

CAS—79-90-3

IUPAC Name 6-[Dimethyl-[4-(2,2,6-trimethylcyclohexyl)butan-2-yl]azanium-yl]hexyl-dimethyl-[4-(2,2,6-trimethylcyclohexyl)butan-2-yl]azanium dichloride

Synonyms N,N' -Bis[1-methyl-3-(2,2,6-trimethylcyclohexyl)propyl]- N,N' -dimethyl-1,6-hexanediamine bis(methochloride); hexamethylenebis(dimethyl[1-methyl-3-(2,2,6-trimethylcyclohexyl)propyl]ammonium chloride); Ro-5-0810/1; N,N,N',N' -tetramethyl- N,N' -bis[1-methyl-3-(2,2,6-trimethylcyclohexyl)propyl]-1,6-hexanediaminium dichloride.

Chemical Properties White crystalline powder. Mp 243° to 253° with decomposition. Soluble in water, chloroform, and alcohol [O'Neil *et al.* 2006]. Insoluble in ether. Log P (octanol/water) 3.74 [Meylan, Howard 1995].

Colour Test Ammonium molybdate test—blue (limit of detection, 1.0 μ g).

Thin-layer Chromatography System T1— R_f 0.01 (location reagent acidified iodoplatinate spray, positive reaction).

Disposition in the Body

Therapeutic Concentration A 0.1% ointment has been shown to be effective topically versus pyogenic dermatoses [Robinson, Harmon 1958], primary and secondary bacterial infections of the skin [Edelson *et al.* 1959], vaginitis [Demetry, Hansen 1960], and cecivitis [Fromhagen 1961], and after plastic surgery following third-degree burns [Georgiade *et al.* 1959]. Triclobisonium chloride has a marked activity against most skin pathogens, including *Staphylococcus aureus*, *Staphylococcus albus*, *Staphylococcus pyogenes* and *Bacillus proteus* [Borsanyi, Blanchard 1961; Gorosin, Blanchard 1961; Hunt, James 1960; Svenson 1960].

Dose Used topically as a 0.1% ointment.

Triclocarban

Disinfectant, Antiseptic

$C_{13}H_9Cl_3N_2O = 315.6$

CAS—101-20-2

IUPAC Name 1-(4-Chlorophenyl)-3-(3,4-dichlorophenyl)urea

Synonyms TCC; 3,4,4'-trichlorocarbanilide.

Proprietary Names *Citrosil Sapone; Cuticura; Cutisan; Derso TCC; Nobacter; Solubacter; Valderma.*

Chemical Properties Fine white plates. Mp 255° to 256°. Practically insoluble in water; soluble 1 in 25 of acetone and 1 in 100 of propylene glycol. Log P (octanol/water), 4.9.

Thin-layer Chromatography System TD— R_f 0.60; system TE— R_f 0.75; system TF— R_f 0.59; system TAD— R_f 0.63.

Ultraviolet Spectrum Ethanol—265 nm ($A_1^1=1391$ b).

Infrared Spectrum Principal peaks at wavenumbers 1634, 1587, 1550, 820, 1089, 1232 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 127, 161, 163, 153, 129, 187, 90, 189.

Quantification

Blood GC ECD. Limit of detection, 12.5 ng/mL [Hoar, Bowen 1977].

Plasma GC-MS Limit of detection, 1.5 ng/mL for 2'-hydroxy sulfate metabolite [Gruenke *et al.* 1997].

Urine GC-MS Limit of detection, 3 ng/mL for N -glucuronide in urine [Gruenke *et al.* 1997].

Use In concentrations of 1 to 2%.

Gruenke LD *et al.* (1997). *J Anal Toxicol* 11: 75–80.

Hoar DR, Bowen MH (1977). GLC determination of free triclocarban in blood. *J Pharm Sci* 66: 725–726.

Triclofos Sodium

Sedative, Hypnotic

$C_2H_3Cl_3NaO_4P = 251.4$

CAS—306-52-5 (triclofos); 7246-20-0 (sodium salt)

IUPAC Name Sodium 2,2,2-trichloroethanol hydrogen phosphate

Proprietary Names *Triclonam; Tricloryl; Triclos.*

Chemical Properties A white hygroscopic powder. Soluble 1 in 2 of water and 1 in 250 of ethanol; practically insoluble in ether. Log P (octanol/water), 1.1.

Colour Test Phosphorus test—yellow precipitate.

Gas Chromatography System GB—RI 1952.

Infrared Spectrum Principal peaks at wavenumbers 1107, 1227, 926, 1124, 709, 876 cm^{-1} (triclofos sodium, (Nujol mull)).

Mass Spectrum Principal ions at m/z 31, 49, 77, 29, 113, 51, 48, 115, no peaks above 120 (triclofos); trichloroacetic acid 44, 83, 85, 36, 28; trichloroethanol 31, 49, 77, 113, 115, 82, 51, 117.

Quantification Determination of trichloroethanol – see under Chloral Hydrate.

Disposition in the Body Rapidly hydrolysed in the stomach to trichloroethanol which is readily absorbed. Trichloroethanol, the active metabolite, is conjugated with glucuronic acid to give urochloral acid, and oxidised to trichloroacetic acid. About 12% of a dose is excreted in the urine in 24 h as metabolites.

Therapeutic Concentration In plasma, trichloroethanol, usually in the range 1.5 to 15 mg/L.

After an oral dose of 22 mg/kg given to 7 subjects, peak plasma concentrations of trichloroethanol and urochloral acid of about 8 mg/L and 2 mg/L, respectively, were reported; no unchanged triclofos was detectable in plasma [Sellers *et al.* 1973].

Toxicity Plasma concentrations >40 mg/L of trichloroethanol are likely to produce toxic effects, and concentrations >100 mg/L may be fatal.

The following postmortem tissue concentrations of trichloroethanol were reported in a fatality due to triclofos ingestion: blood 335 $\mu\text{g}/\text{mL}$, bile 696 $\mu\text{g}/\text{L}$, brain 326 $\mu\text{g}/\text{g}$, kidney 928 $\mu\text{g}/\text{g}$, liver 690 $\mu\text{g}/\text{g}$, urine 195 mg/L ; other drugs were also detected [Doedens, Benz 1976].

Half-life Plasma half-life, trichloroethanol about 8 h, urochloral acid about 7 h, trichloroacetic acid about 4 days.

Volume of Distribution Trichloroethanol, about 0.6 L/kg.

Distribution in Blood Plasma : whole blood ratio, trichloroethanol about 0.9.

Protein Binding Trichloroethanol about 35% and trichloroacetic acid about 94%.

Dose 1 to 2 g, as a hypnotic.

Doedens DJ, Benz JA (1976). *Bull Int Assn Forens Toxicol* 12(2): 10–11.
Sellers EM *et al.* (1973). *Clin Pharmacol Ther* 14:147.

Triclosan

Disinfectant

$\text{C}_{12}\text{H}_7\text{Cl}_3\text{O}_2 = 289.5$

CAS—3380-34-5

IUPAC Name 5-Chloro-2-(2,4-dichlorophenoxy)phenol

Synonym Cloxifenol

Proprietary Names Acneclear, Adasept, Aquasept, Bioband, Dermax, Dermo-Steril, Fisohex, Gamophen, Geroderm, Irgasan DP300, Novaderm, Procontol, Proderm, Sapoderm, Septisol, Solyptol, Ster-Zac, Stri-Dex, Tersaseptic, Zalclense.

Chemical Properties A white crystalline powder or soft agglomerates. Mp 54° to 57°. Practically insoluble in water; very soluble in most organic solvents. pK_a 7.9. Log P (octanol/water), 4.8.

Ultraviolet Spectrum Ethanol—283 nm ($A_1^1=179$ b); alkaline ethanol—295 nm.

Mass Spectrum Principal ions at m/z 288, 290, 218, 146, 114, 63, 51, 148.

Quantification

Plasma GC ECD. Limit of detection, 2 $\mu\text{g}/\text{L}$ [Sioufi *et al.* 1977].

Urine GC See Plasma [Sioufi *et al.* 1977].

Disposition in the Body

Therapeutic Concentration

In a single dose study, subjects brushed one time with 1.25 g dentifrice containing 0.3% triclosan (3.75 mg) and ingested all of the dentifrice. Blood samples were collected at multiple time points from pre-dose to 72 h post-dose. In a multiple dose study, the same subjects brushed 3 times daily as in the single dose study. After 12 days of 3 times daily toothbrushing and ingestion of the dental slurry, the mean triclosan plasma concentration was 352 $\mu\text{g}/\text{L}$ in the steady state period. There was no significant difference between results obtained in the single dose study, suggesting a complete elimination of daily triclosan dose and no increase in the triclosan level during repeated brushing/ingestion [Bagley, Lin 2000].

Use In concentrations of 0.05 to 2%.

Bagley DM, Lin YJ (2000). Clinical evidence for the lack of triclosan accumulation from daily use in dentifrices. *Am J Dent* 13: 148–152.

Sioufi A *et al.* (1977). GLC determination of free and conjugated triclosan in human plasma and urine. *J Pharm Sci* 66: 1166–1168.

Tricyclamol Chloride

Anticholinergic

$\text{C}_{20}\text{H}_{32}\text{ClNO} = 337.9$

CAS—3818-88-0

IUPAC Name 1-Cyclohexyl-3-(1-methylpyrrolidin-1-ium-1-yl)-1-phenylpropan-1-ol chloride

Synonym 1-(3-Cyclohexyl-3-hydroxy-3-phenylpropyl)-1-methylpyrrolidinium chloride

Chemical Properties A white crystalline powder. Mp 165° to 168°. Soluble 1 in 3 of water, 1 in 3 of ethanol and 1 in 25 of chloroform; practically insoluble in ether.

Colour Tests Mandelin's test—grey-violet; Marquis test—violet.

Thin-layer Chromatography System TA— R_f 0.06. (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—251, 257 ($A_1^1=5.7$ a), 263 nm. No alkaline shift.

Infrared Spectrum Principal peaks at wavenumbers 705, 920, 1115, 772, 1045, 1061 cm^{-1} (KBr disk).

Dose Tricyclamol chloride has been given in doses of 50 to 100 mg.

Tridihexethyl Chloride

Anticholinergic

$\text{C}_{21}\text{H}_{36}\text{ClNO} = 354.0$

CAS—60-49-1 (tridihexethyl); 4310-35-4 (chloride)

IUPAC Name γ -Cyclohexyl-*N,N,N*-triethyl- γ -hydroxybenzenepropanaminium chloride

Proprietary Names *Pathilon*. It is an ingredient of *Milpath*.

Chemical Properties A white crystalline powder. Mp 196° to 202°. Soluble 1 in 3 of water, 1 in 3 of ethanol and 1 in 2 of chloroform; practically insoluble in ether.

Colour Tests Mandelin's test—violet; Marquis test—brown-violet.

Thin-layer Chromatography System TA— R_f 0.07. (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—251, 257, 263 nm. No alkaline shift.

Infrared Spectrum Principal peaks at wavenumbers 717, 1492, 710, 769, 1162, 729 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 86, 58, 88, 105, 206, 87, 55, 77.

Dose 75 to 300 mg daily.

Trientine

Copper Chelator

$\text{C}_6\text{H}_{18}\text{N}_4 = 146.2$

CAS—112-24-3

IUPAC Name *N,N'*-Bis(2-aminoethyl)ethane-1,2-diamine

Synonyms TECZA; TETA; trien; triethylenetetramine.

Chemical Properties An oily liquid. Mp 12°. Bp 266° to 267°. Soluble in water and alcohol, and is corrosive. pK_a 9.92 (20°). Log *P* (octanol/water), -2.65.

Trientine Dihydrochloride

$\text{C}_6\text{H}_{18}\text{N}_4 \cdot 2\text{HCl} = 219.2$

CAS—38260-01-4

Synonyms MK-0681; TECZA; TETA; trien hydrochloride; trientine hydrochloride; triethylenetetramine dihydrochloride.

Proprietary Name *Syprine*

Chemical Properties A white to pale yellow crystalline powder. Mp 115° to 118°. Freely soluble in water; soluble in methyl alcohol; slightly soluble in alcohol; practically insoluble in chloroform and ether.

Quantification

Blood HPLC Column: Nucleosil 5-CN (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: 140 mmol/L ammonium chloride (containing 48 mmol/L sodium benzene sulfonate, and 9.2 mmol/L acetic acid (pH 6, 27:73)), flow rate 0.5 mL/min. Fluorescence detection ($\lambda_{\text{ex}}=380$ nm, $\lambda_{\text{em}}=485$ nm). RT: 9.5 min. Limit of detection, 100 $\mu\text{g/L}$ [Miyazaki *et al.* 1990].

Disposition in the Body Trientine is rapidly absorbed after oral administration. High concentrations of the metabolites are detected in the blood at the early stages following administration. It is widely distributed throughout the body. Urine and faeces are the major routes of elimination, with a large amount of metabolites being detected in urine. 1-*N*-acetyltriethylene tetramine (acetyltrien) has been identified in urine. This metabolite has chelating activity which is significantly lower than trientine. Both drug and metabolite are capable of combining with copper, iron and zinc. After oral administration, approx. 1.6% of an administered dose is detected in urine unchanged, and 8% as acetyltrien. The majority of the drug is excreted within the first 6 h, and the metabolite excreted over 26 h.

Bioavailability 90 to 95%.

Dose Adults: (US guidelines) the usual initial dose is 750 to 1250 mg daily which may be increased to a maximum of 2 g daily; (UK guidelines) 1.2 to 2.4 g daily is recommended. Children: the usual initial dose is 500 to 750 mg which may be increased to a maximum of 1.5 g daily if necessary.

Miyazaki K *et al.* (1990). Determination of triethylenetetramine in plasma of patients by high-performance liquid chromatography. *Chem Pharm Bull* 38: 1035-1038.

Triflumuron

Benzoylurea, Insecticide

$\text{C}_{15}\text{H}_{10}\text{ClF}_3\text{N}_2\text{O}_3 = 358.7$

CAS—64628-44-0

IUPAC Name 2-Chloro-*N*-[[4-(trifluoromethoxy)phenyl]carbonyl]benzamide

Synonyms BAY SIR-8514; *N*-(2-chlorobenzoyl)-*N'*-[4-(trifluoromethoxy)phenyl]urea, 2-chloro-*N*-[[4-(trifluoromethoxy)phenyl]amino]carbonyl]benzamide; SIR-8514; trifluron.

Proprietary Names *Alsystin*; *Baycidal*; *Starycide*.

Chemical Properties Crystals. Mp 198°. Slightly soluble in water (0.025 mg/L). Log *P* (octanol/water), 4.91 [Ticha *et al.* 2007].

Mass Spectrum Principal peaks at m/z 357, 359, 289, 309, 337, 381, 467, 487, 511.

Quantification No data have been reported for triflumuron concentrations in human fluids or tissues.

Other HPLC Tomatoes. Column: C_{18} (250 × 4.6 mm i.d., 5.0 μ m). Mobile phase: methanol:water (80:20), flow rate 0.6 mL/min. UV detection ($\lambda = 260$ nm). Retention time: 11 min. Limit of quantification, 40 μ g/L; limit of detection, 10 μ g/L [Markoglou *et al.* 2007]. Column: Spherisorb C_{18} (150 × 3.9 mm i.d., 4 μ m). Mobile phase: methanol:water (80:20), flow rate 0.4 mL/min. Fluorescence detection ($\lambda_{ex} = 330$ nm, $\lambda_{em} = 410$ nm). Retention time: \approx 8 min. Limit of quantification, 50 μ g/L; limit of detection, 13 μ g/L [Martinez-Galera *et al.* 2001]. Grapes and Wine. Column: Hypersil C_{18} (250 × 2.1 mm i.d., 5 μ m). Mobile phase: methanol:water (10:90 for 5 min, to 64:36 over 15 min, to 100:0 over 20 min), flow rate 0.3 mL/min. UV detection ($\lambda = 260$ nm). Retention time: \approx 31 min. Limit of quantification, 4 to 5 μ g/L [Miliadis *et al.* 1999]. Water. Column: Zorbax SB- C_{18} (250 × 4.6 mm i.d., 5 μ m). Mobile phase: acetonitrile:water with orthophosphoric acid (pH 2.5; 90:10 for 5 min, to 10:90 over 30 min), flow rate 2 mL/min. Retention time: 27 min. Limit of detection, 6 μ g/L [Dommarco *et al.* 1998].

LC-MS Apples. Column: C_{18} (150 × 3.0 mm i.d., 5 μ m). Mobile phase: water: methanol (50:50 to 0:100 over 6 min for 11 min). ESI, positive ion mode, MRM acquisition mode. Limit of detection, 4 μ g/kg [Ticha *et al.* 2007]. Tomatoes. Column: C_{18} (250 × 4.6 mm i.d., 5 μ m). Mobile phase: methanol:water (80:20), flow rate 0.6 mL/min. APCI, negative ion mode, SIM acquisition mode. Retention time: 11 min. Limit of quantification, 30 μ g/L, limit of detection, 8 μ g/L [Markoglou *et al.* 2007].

Dose Used in agriculture and as a topical ectoparasiticide in veterinary practice.

Dommarco R *et al.* (1998). Simultaneous quantitative determination of thirteen urea pesticides at sub-ppb levels on a Zorbax SB- C_{18} column. *J Chromatogr A* 825: 200-204.

Markoglou AN *et al.* (2007). Determination of benzoylurea insecticide residues in tomatoes by high-performance liquid chromatography with ultraviolet-diode array and atmospheric pressure chemical ionization-mass spectrometry detection. *J AOAC Int* 90: 1395-1401.

Martinez-Galera M *et al.* (2001). Determination of benzoylureas in tomato by high-performance liquid chromatography using continuous on-line post-elution photoirradiation with fluorescence detection. *J Chromatogr A* 918: 79-85.

Miliadis GE *et al.* (1999). High-performance liquid chromatographic determination of benzoylurea insecticides residues in grapes and wine using liquid and solid-phase extraction. *J Chromatogr A* 835: 113-120.

Ticha J *et al.* (2007). Safe apples for baby-food production: survey of pesticide treatment regimes leaving minimum residues. *Food Addit Contam* 24: 605-620.

Trifluomeprazine

Tranquilliser (Veterinary)

$C_{19}H_{21}F_3N_2S = 366.4$

CAS—2622-37-9

IUPAC Name *N,N,2*-Trimethyl-3-[2-(trifluoromethyl)phenothiazin-10-yl]propan-1-amine

Synonyms Triflutrimprazine; *N,N,\beta*-trimethyl-2-(trifluoromethyl)-10H-phenothiazine-10-propanamine.

Trifluomeprazine Maleate

$C_{19}H_{21}F_3N_2S.C_4H_4O_4 = 482.5$

Proprietary Name Nortran

Chemical Properties A white crystalline powder. Mp about 178°. Very slightly soluble in water; soluble 1 in 25 of ethanol and 1 in 25 of chloroform; practically insoluble in ether.

Colour Tests Mandelin's test—green→red-violet; Marquis test—red-violet; sulfuric acid—red-violet.

Thin-layer Chromatography System TA— R_f 0.65; system TB— R_f 0.60; system TC— R_f 0.58; system TL— R_f 0.52 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2250.

Ultraviolet Spectrum Aqueous acid—255 ($A_1^1 = 803$ a), 305 nm, less well-defined.

Mass Spectrum Principal ions at m/z 58, 366, 59, 100, 266, 248, 84, 44.

Trifluoperazine

Neuroleptic, Phenothiazine, Tranquilliser

$C_{21}H_{24}F_3N_3S = 407.5$

CAS—117-89-5

IUPAC Name 10-[3-(4-Methyl-1-piperazinyl)propyl]-2-(trifluoromethyl)-10H-phenothiazine

Chemical Properties Serum samples were stable for up to 8 h at room temperature and up to 2 weeks when stored at 4° and -20° [Tanaka *et al.* 2007]. Standard solutions were stable for up to 3 weeks when kept at -16° in the dark [Javid *et al.* 1982]. Plasma samples were stable for 3 weeks at -4° [Midha *et al.* 1982]. Plasma samples were stable for several days when stored at 9° [Gillespie, Sipes 1981].

Trifluoperazine Hydrochloride

$C_{21}H_{24}F_3N_3S.2HCl = 480.4$

CAS—440-17-5

Synonym Triphthazinum

Proprietary Names Eskazine; Flupazine; Jatroneural; Modalina; Novoflurazine; Slezime; Terfluzine; Triplex. It is an ingredient of Parstelin and Stelabid.

Chemical Properties White to pale-yellow, hygroscopic, crystalline powder. Mp 242° to 243°. Soluble 1 in 2 of water, 1 in 11 of ethanol, and 1 in 100 of chloroform; practically insoluble in ether. pK_a 8.1 (24°). Log *P* (octanol/water), 5.0.

Colour Tests Formaldehyde-sulfuric acid—pink; Forrest reagent—orange; FPN reagent—orange; Liebermann's reagent—red; Mandelin's test—red-brown; Marquis test—red-violet.

Thin-layer Chromatography System TA— R_f 0.53; system TAE— R_f 0.30; system TAF— R_f 0.29; system TAG— R_f 0.08; system TB— R_f 0.33; system TC— R_f 0.30; system TE— R_f 0.55 (Dragendorff spray, positive; FPN reagent, pink; acidified iodoplatinate solution, positive; Marquis reagent, pink).

Gas Chromatography System GA—trifluoperazine RI 2683; M (ring) RI 2190; M (sulfoxide) RI 2990; system GB—trifluoperazine RI 2798; M (sulfoxide) RI 3145; M (norsulfoxide) RI 3191; system GF—RI 3050.

High Performance Liquid Chromatography System HA—*k* 3.0; system HAA—RT 17.7 min; system HX—RI 480; system HY—RI 344; system HZ—RT 13.2 min.

Column: Discovery C_{18} (150 × 4.6 mm i.d., 5 μ m). Mobile phase: 575 mg ammonium formate with 1.3 mL formic acid in 500 mL water: acetonitrile (60:40 for 3 min to 20:80 at 11 min to 0:100 at 12 min to 60:40 at 13 min for 2 min), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 378$ nm, $\lambda_{em} = 502$ nm at 0.01 min to $\lambda_{ex} = 344$ nm; $\lambda_{em} = 380$ nm at 4.75 min to $\lambda_{ex} = 351$ nm, $\lambda_{em} = 436$ nm at 8.35 min to $\lambda_{ex} = 344$ nm, $\lambda_{em} = 389$ nm at 10 min; $\lambda_{ex} = 344$ nm, $\lambda_{em} = 379$ nm). Limit of detection, 4 nmol/L [Diehl, Karst 2000].

Ultraviolet Spectrum Aqueous acid—256 ($A_1^1 = 743$ a), 305 nm; aqueous alkali—258, 308 nm.

Infrared Spectrum Principal peaks at wavenumbers 1114, 1316, 1145, 1081, 755, 1255 cm^{-1} (trifluoperazine hydrochloride, KBr disk).

Mass Spectrum Principal ions at m/z 113, 70, 407, 43, 141, 42, 127, 71.

Quantification

Plasma GC Column: 3% OV-101 on 80/100 mesh (0.9 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 250°. NPD. Limit of detection, 0.2 µg/L [Javaid *et al.* 1982]. Column: 3% phenylmethylsilicone 100/120 mesh (1.8 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 310°. NPD. Retention time: 0.89 min. Limit of detection, 0.5 µg/L [Roscoe *et al.* 1982]. Column: 3% OV-17 on Gas-Chrom Q, 80/100 mesh (2 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 260°. NPD. Limit of detection, 0.1 µg/L [Gillespie, Sipes 1981].

GC-MS Column: 3% OV-1 dimethylchlorosilane Gas Chrom Q on 100/120 mesh (1.22 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 280°. EI ionisation, SIR acquisition mode. Retention time: 1 min 17 s. Limit of quantification, 78 ng/L [Midha *et al.* 1982]. Column: 3% OV-225 on 80/100 Chromosorb W HP (1 m × 4 mm i.d.). Carrier gas: He, 20 mL/min. Temperature: 245°. SIM acquisition mode. Limit of detection, 0.2 µg/L [Whelpton *et al.* 1982].

HPLC Column: SymmetryShield RP8 (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: 10 mmol/L ammonium formate and 0.1% formic acid:acetonitrile (70:30 to 0:100 at 15 min), flow rate 0.2 mL/min. UV detection (λ = 250 nm). Limit of detection, 0.021 mg/L [Marumo *et al.* 2005].

Serum HPLC Column: Inersil ODS-SP C₁₈ (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile:methanol:30 mmol/L sodium dihydrogen phosphate (pH 5.6, 300:200:500), flow rate 0.9 mL/min. UV detection (λ = 250 nm). Retention time: 62.0 min. Limit of quantification, 5.2 µg/L [Tanaka *et al.* 2007].

Urine GC Column: 5% OV-1 on Diatoport S, 80/100 mesh or 2% FFAP on Diatoport S, 80/100 mesh. Carrier gas: N₂, 60–80 mL/min. Temperature: 230°. FID. Retention time: 6.9 and 13.6 min for each column, respectively. Limit of detection, 5–10 µg/L [De Leenheer 1974].

HPLC Column: LiChrosorb C₈ (150 × 4.6 mm i.d.). Mobile phase: acetonitrile:water:acetic acid:triethylamine (40:40:20:2), flow rate 0.5 mL/min. UV detection (λ = 250 nm). Limit of quantification, 112.2 µg/L, limit of detection, 33.6 µg/L [Cruz-Vera *et al.* 2009]. See Plasma. Limit of detection, 0.3 mg/L [Marumo *et al.* 2005].

Hair GC Column: AC-5 capillary (15 m × 0.25 mm i.d.). Temperature programme: 180° to 270° at 10°/min for 10 min. NPD. Limit of detection not reported [Shen *et al.* 2002].

LC-MS Column: Luna C₁₈ (15 cm × 4.6 mm i.d.). Mobile phase: 0.02 mol/L ammonium acetate and 0.1% acetic acid in water:acetonitrile (35:65), flow rate 0.5 mL/min. ESI. Limit of detection, 60 nmol/L [McClean *et al.* 2000].

Note For a radioimmunoassay method for the detection of trifluoperazine see Midha *et al.* [1981].

Disposition in the Body Absorbed after oral administration. About 1% of a daily dose is excreted in the 24 h urine as unchanged drug and up to 6% of a dose as the sulfoxide [West *et al.* 1974]. Metabolism to 7-hydroxytrifluoperazine and desmethyltrifluoperazine has been reported.

Therapeutic Concentration

After a single oral dose of 5 mg to 5 healthy subjects, peak plasma concentrations of 0.5–3.0 µg/L (mean, 1.4 µg/L) were reached between 1–4 h. [Midha *et al.* 1983].

After a single oral dose of 20 mg to 4 subjects, peak plasma concentrations of 0.001–0.004 µg/mL (mean 0.002) were attained in 3–6 h [Gillespie, Sipes 1981].

After daily oral doses of 80 mg to 1 subject, a peak plasma concentration of 0.028 µg/mL was reported 8 h after a dose [Curry *et al.* 1981].

Toxicity

Postmortem blood and liver concentrations of 0.06 µg/mL and 0.31 µg/g respectively were reported in a woman who died of suspected trifluoperazine overdose whilst receiving daily oral doses of 40 mg [Baselt 2005].

The following postmortem concentrations were reported in a fatality attributed to trifluoperazine ingestion: blood 0.4 µg/mL, kidney 83 µg/g, liver 198 µg/g; 7-hydroxytrifluoperazine, kidney 61 µg/g, liver 161 µg/g; desmethyltrifluoperazine, kidney 89 µg/g, liver 205 µg/g [Quai *et al.* 1985].

Half-life Plasma half-life, 7–18 h (mean 12).

Dose For psychoses, the equivalent of 10 to 20 mg of trifluoperazine daily; more than 40 mg daily has been given.

Trifluoromethylphenylpiperazine

5-HT₁ Receptor Agonist, Stimulant

C₁₁H₁₃F₃N₂=230.2

CAS—15532-75-9

IUPAC Name 1-[3-Trifluoromethylphenyl]piperazine

Synonyms TFMPP; *m*-trifluoromethylphenylpiperazine.

Street Names TFMPP; Legal E; Legal X.

Chemical Properties Mp 89° to 92°. Bp 65° to 71°. pK_a 8.66 [Bishop *et al.* 2005].

Trifluoromethylphenylpiperazine Hydrochloride

C₁₁H₁₃F₃N₂·HCl = 266.7

Chemical Property Solid

UV Spectrum Peaks at 220, 250 nm.

Mass Spectrum Principal ions at *m/z* 272, 229, 200, 188, 145, 172, 56 (AC derivative); 326, 229, 200, 187, 175, 56 (Trifluoroacetic acid derivative); 426, 229, 200, 172, 145, 56 (HFBA derivative).

Quantification

Plasma GC-MS Column: HP-5MS capillary 5% phenylmethylsiloxane (30 m × 0.25 mm i.d., 250 nm). Carrier gas: He, 0.6 mL/min. Temperature programme: 100° to 250° at 10°/min to 310° at 30°/min for 1 min. EI ionisation, SIM acquisition mode. Limit of quantification, 5 µg/L, limit of detection, ~1 µg/L [Peters *et al.* 2003]. Column: HP-5MS (19 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 90° for 1 min to 300° at 15°/min for 5 min. EI ionisation at 70 eV. Limit of quantification not reported [de Boer *et al.* 2001].

Urine GC-MS Column: Fused silica capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 80° for 1 min to 250° at 10°/min. EI ionisation at 70 eV. Limit of detection, 100 µg/L for TFMPP and 500 µg/L for 4-hydroxy-TFMPP [Tsutsumi *et al.* 2005].

LC-MS Column: SCX (150 × 0.2 mm i.d.). Mobile phase: acetonitrile : 40 mmol/L ammonium acetate (pH 4; 75 : 25), flow rate 0.15 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of detection, 0.2 µg/L for TFMPP and 1 µg/L for 4-hydroxy-TFMPP [Tsutsumi *et al.* 2005].

Disposition in the Body TFMPP is metabolised by isoenzymes CYP2D6 (predominant catalyser), CYP1A2, and CYP3A4, forming *N*-(3-trifluoromethyl-phenyl)ethylenediamine, *N*-(hydroxyl-3-trifluoromethylphenyl)ethylenediamine, 3-trifluoromethylaniline and hydroxyl-3-trifluoromethylalanine. Subsequent glucuronidation, sulfatation and acetylation also occur.

Note TFMPP is a metabolite of antrafenine.

Toxicity At the time of writing (2007), there have been no published cases of fatal TFMPP toxicity. It has CNS activity, acting on the serotonergic system and may produce effects similar to MDMA. For further reading, see Maurer *et al.* [2004] and Murphy *et al.* [1991].

Trifluoperidol

Butyrophenone, Tranquilliser

C₂₂H₂₃F₄NO₂ = 409.4

CAS—749-13-3

IUPAC Name 1-(4-Fluorophenyl)-4-[4-hydroxy-4-[3-(trifluoromethyl)phenyl]-1-piperidinyl]-1-butanone

Synonym Flumoperone

Chemical Properties White crystalline powder. Mp 93° to 95°. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Trifluoperidol Hydrochloride

C₂₂H₂₃F₄NO₂·HCl = 445.9

CAS—2062-77-3

Proprietary Names *Psicoperidol; Triperidol.*

Chemical Properties White, amorphous or crystalline, flocculent powder which is stable in air but darkens slowly on exposure to light. Mp about 201°. Slightly soluble in water and chloroform; soluble in ethanol; practically insoluble in ether; freely soluble in methanol. Log *P* (octanol/water), 4.5.

Thin-layer Chromatography System TA—R_f 0.73; system TAD—R_f 0.26; system TAE—R_f 0.55; system TAF—R_f 0.76; system TB—R_f 0.13; system TD—R_f 0.02; system TE—R_f 0.77; system TF—R_f 0.05 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2675; M (*N*-desalkyl-oxo-2H₂O) RI 1570; M (*N*-desalkyl-) RI 1970.

High Performance Liquid Chromatography System HA—*k* 1.2; system HAA—RT 21.6 min; system HX—RI 459; system HY—RI 306.

Ultraviolet Spectrum Aqueous acid—248 nm (A₁¹ = 308a).

Infrared Spectrum Principal peaks at wavenumbers 1317, 1150, 1665, 1170, 1110, 1595 cm⁻¹ (trifluoperidol hydrochloride, KBr disk).

Mass Spectrum Principal ions at *m/z* 42, 271, 258, 123, 56, 83, 240, 95.

Quantification

Plasma GC Column: 3% OV-17 on Gas Chrom Q 100/120 mesh (2 m × 2 mm i.d.). Carrier gas: N₂, 40 mL/min. Temperature: 270°. ECD. Limit of detection, 1 ng [Marcucci *et al.* 1971].

HPLC [Przyborowski, Misztal 1991].

Tissues GC See Plasma [Marcucci *et al.* 1971].

Dose Initially the equivalent of 500 µg of trifluoperidol daily, increased to a maximum dose of 8 mg daily.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.

Marcucci F *et al.* (1971). A method for the gas chromatographic determination of butyrophenones. *J Chromatogr* 59: 174–177.

Przyborowski L, Misztal G (1991). [HPLC-determination of trifluoperidol in blood plasma]. *Pharmazie* 46: 813–814.

Triflupromazine

Antiemetic, Antipsychotic, Phenothiazine, Tranquilliser

C₁₈H₁₉F₃N₂S = 352.4

CAS—146-54-3

IUPAC Name *N,N*-Dimethyl-3-[2-(trifluoromethyl)phenothiazin-10-yl]propan-1-amine

Synonyms *N,N*-Dimethyl-2-(trifluoromethyl)-10*H*-phenothiazine-10-propa-namine; fluopromazine.

Chemical Properties A pale-amber viscous oily liquid which forms large irregular crystals during prolonged storage. Practically insoluble in water. p*K*_a 9.2 (24°). Log *P* (octanol/water), 5.5. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Triflupromazine Hydrochloride

C₁₈H₁₉F₃N₂S·HCl = 388.9

CAS—1098-60-8

Proprietary Names *Psyquil; Siquil; Vesprin.*

Chemical Properties White to pale-tan crystalline powder. Mp 170° to 178°. Soluble 1 in less than 1 of water and of ethanol, and 1 in 1.7 of chloroform; soluble in acetone; practically insoluble in ether.

Colour Tests Formaldehyde–sulfuric acid—red; Forrester reagent—orange; FPN reagent—orange; Mandelin's test—red-brown; Marquis test—red-violet.

Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.47; system TC—R_f 0.35; system TE—R_f 0.75; system TL—R_f 0.22; system TAE—R_f 0.32; system TAF—R_f 0.49 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—triflupromazine RI 2230, M-ring RI 2190; system GB—triflupromazine RI 2318; system GF—triflupromazine RI 2550; system GW—triflupromazine RT 19.3 min.

High Performance Liquid Chromatography System HA—*k* 2.7; system HX—RI 484; system HY—RI 454; system HZ—RT 12.3 min; system HAX—RT 17.3 min; system HAY—RT 8.9 min.

Ultraviolet Spectrum Aqueous acid—256 (A₁¹ = 874a), 305 nm.

Infrared Spectrum Principal peaks at wavenumbers 1117, 1316, 1159, 1237, 1075, 1030 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 58, 352, 86, 353, 85, 306, 42, 266.

Quantification

Blood GC Column: Supelco Equity 5 fused silica (30 m \times 0.32 mm i.d., 0.25 μm). Carrier gas: He, 3 mL/min. Temperature programme: 140° for 1 min to 300° at 15°/min. NPD. Limit of detection, 2.4 $\mu\text{g/L}$ [Shinmen *et al.* 2008].

Plasma GC See Blood. Limit of detection, 0.6 $\mu\text{g/L}$ [Shinmen *et al.* 2008].

Urine GC-MS Column: HP (12 m \times 0.12 mm i.d., 0.33 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 5 min. EI ionisation at 70 eV, scan mode. Limit of detection not reported [Maurer, Pfeleger 1988].

Disposition in the Body

Toxicity A concentration of 10 $\mu\text{mol/L}$ trifluoropromazine was found to be phytotoxic in human erythrocytes [Eberlein-König *et al.* 1997]

Dose 20 to 150 mg of trifluoropromazine hydrochloride daily.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.
Eberlein-König B *et al.* (1997). Phototoxic properties of neuroleptic drugs. *Dermatology* 194: 131–135.

Shinmen N *et al.* (2008). Simultaneous determination of some phenothiazine derivatives in human blood by headspace solid-phase microextraction and gas chromatography with nitrogen-phosphorus detection. *JAOAC Int* 91: 1354–1362.

Trihexyphenidyl

Anticholinergic

$\text{C}_{20}\text{H}_{31}\text{NO}$ = 301.5

CAS—144-11-6

IUPAC Name 1-Cyclohexyl-1-phenyl-3-piperidin-1-ylpropan-1-ol
Synonyms Benzhexol; α -cyclohexyl- α -phenyl-1-piperidinepropanol.

Chemical Properties Mp 114.3° to 115.0°. Blood and urine samples containing trihexyphenidyl proved stable when stored for 6 months at -20° or 4° and for 3 months at 25° [Battah, Hadidi 1998]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Trihexyphenidyl Hydrochloride

$\text{C}_{20}\text{H}_{31}\text{NO}\cdot\text{HCl}$ = 337.9

CAS—52-49-3

Synonyms Cyclodolum; trihexyphenidylum chloride.

Proprietary Names *Aparkane*; *Apo-Trihex*; *Artandy*; *Artane*; *Broflex*; *Cyclodol*; *Hipokinin*; *Kexidil*; *Novohexidyl*; *Pacitane*; *Paralest*; *Pargitan*; *Parkinane*; *Parkopan*; *Partane*; *Peragit*; *Pipanol*; *Sedrena*; *Tremim*, *Trihexy*; *Triphedionin*; *Triphediny*; *Tsiklodol*; *Trixy*. It is an ingredient of *Largatrex* and *Spasman*.

Chemical Properties White or creamy-white crystalline powder. Mp $\approx 258.5^\circ$, with decomposition. Soluble 1 in 100 of water, 1 in 6 of alcohol, 1 in 5 chloroform. More soluble in methanol, very slightly soluble in ether and benzene. Log *P* (octanol/water), 5.27.

Colour Tests Mandelin's test—grey-green; Marquis test—grey-violet.

Thin-layer Chromatography System TA— R_f 0.68; system TB— R_f 0.66; system TC— R_f 0.61; system TE— R_f 0.83; system TL— R_f 0.59; system TAE— R_f 0.43; system TAF— R_f 0.75; system TAJ— R_f 0.38; system TAK— R_f 0.22; system TAL— R_f 0.80 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—trihexyphenidyl RI 2245, M (OH-) RI 2500; system GB—trihexyphenidyl RI 2354, M (OH-) RI 2618.

Gas Chromatography-Mass Spectrometry Column: BP1 methyl silicone (12.5 m \times 0.22 mm i.d., 0.12 μm). Carrier gas: He, 1 mL/min. Temperature programme: 90° for 45 s to 270° at 25°/min for 3 min. Retention time: 8.05 min [Desage *et al.* 1991].

High Performance Liquid Chromatography System HA—*k* 1.8; system HX—RI 429; system HY—RI 381; system HZ—RT 7.6 min; system HAA—RT 15.3 min.

Ultraviolet Spectrum Aqueous acid—252 ($A_1^1 = 6c$), 258 ($A_1^1 = 7c$), 264 nm ($A_1^1 = 6c$).

Infrared Spectrum Principal peaks at wavenumbers 702, 756, 973, 1206, 1196, 935 cm^{-1} (trihexyphenidyl hydrochloride, KBr disk).

Mass Spectrum Principal ions at m/z 98, 105, 55, 41, 99, 77, 218, 84.

Quantification

Blood GC Column: HP1 (5 m \times 0.53 mm i.d., 2.65 μm). Carrier gas: N_2 , 10 mL/min. Temperature programme: 180° for 2 min to 280° at 8°/min for 3 min. NPD. Limit of detection not reported [Battah, Hadidi 1998].

HPLC Spherisorb-ODS (10 \times 0.5 cm). Mobile phase: acetonitrile:10 mmol/L potassium phosphate buffer (pH 3.0; 55:45), flow rate 1.5 mL/min. UV detection ($\lambda = 214$ nm). Limit of detection not reported [Gall *et al.* 1995].

Plasma GC Column: 3% OV-17 on 100/120 mesh (6' × 2 mm i.d.). Carrier gas: N₂, 35 psi. Temperature: 248°. NPD. Limit of detection 2 and 1 µg/L for trihexyphenidyl and its hydroxylated metabolite, respectively, [Kintz *et al.* 1989]. Column: OV-17 fused silica capillary (25 m × 0.25 mm i.d., 0.1 µm). Carrier gas: He, 2.3 kg/cm². Temperature programme: 150° for 0.6 min to 230° at 30°/min to 245° at 5°/min to 280° at 30°/min. FTD. Limit of detection, 50 ng/L [Owen *et al.* 1989].

GC-MS Column: Teknokroma TRACSIL Meta.X5 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 150° for 1 min to 250° at 25°/min for 1 min to 280° at 8°/min for 7 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 8.92 min. Limit of detection, 0.5 µg/L [Hadidi 2004]. Column: BP1 methyl silicone capillary (12.5 m × 0.22 mm i.d., 0.12 µm). Carrier gas: He, 0.4 kg/cm². Temperature programme: 90° for 90 s to 270° at 25°/min for 3 min. EI ionisation. Limit of quantification, 5 ng/mL, limit of detection, 1 ng/mL [Desage *et al.* 1991].

Serum GC See Plasma [Owen *et al.* 1989].

LC-MS Column: Cyclobond I 2000 native β-cyclodextrin (250 × 2.0 mm i.d., 0.5 µm). Mobile phase: 0.05 mol/L ammonium acetate: acetonitrile (90:10), flow rate 1.0 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of detection, 1 µg/L [Capka, Xu 2001]. Column: Cyclobond I 2000 native β-cyclodextrin (250 × 4.6 mm i.d.). Mobile phase: acetonitrile: methanol: acetic acid: triethylamine (95:1:0.5:0.3). ESI, SIM acquisition mode. Limit of detection, 0.1 µg/L [Capka *et al.* 1999].

CE Capillary: untreated fused silica (57/49.5 cm total/effective length or 66.5/59.8 cm total/effective length, 75 µm i.d.). Buffer: 50 mmol/L sodium phosphate and 50 mmol/L phosphoric acid, with or without β-cyclodextrin. UV detection (λ = 190 nm). Limit of detection, 220 mg/L [Vargas *et al.* 1998].

Urine GC See Blood [Battah, Hadidi 1998]. See Plasma [Kintz *et al.* 1989]. See Plasma [Owen *et al.* 1989].

GC-MS See Plasma [Hadidi 2004].

Gastric Contents HPLC See Blood [Gall *et al.* 1995].

Hair GC Column: AC-5 capillary (15 m × 0.25 mm i.d.). Temperature programme: 180° to 270° at 10°/min for 10 min. NPD. Limit of detection, 0.1–0.5 µg/g [Shen *et al.* 2002].

GC-MS Column: DB-5 (30 m × 0.25 mm i.d.). Carrier gas: CH₄. Temperature programme: 100° for 2 min to 150° at 10°/min to 280° at 25°/min. CI, full scan mode. Retention time: 10.0 min [Shen *et al.* 2002].

Liver HPLC See Blood [Gall *et al.* 1995].

Disposition in the Body Absorbed after oral administration; disappears rapidly from the tissues.

Note For a radioimmunoassay for the detection of trihexyphenidyl, see He *et al.* [1995].

Toxicity In some patients, doses >12 mg daily may produce severe mental disturbance and excitement.

The following postmortem concentrations were observed in a 48-year-old schizophrenic male: femoral artery blood 0.12 mg/L, liver 0.5 µg/g, gastric contents 0.4 mg trihexyphenidyl (benzhexol). Other drugs were not detected. It is suggested that for fatalities to occur following trihexyphenidyl intoxication, secondary contributory factors, which probably further alter the conscious state, are necessary [Gall *et al.* 1995].

The following postmortem concentrations were observed in a 16-year-old youth who experienced hallucinations and was found dead in a nearby lake 2 days after the ingestion of 20 mg of trihexyphenidyl: blood 0.03 mg/L, urine 0.38 mg/L [Kopjak, Jennison 1976].

Dose 1 mg of trihexyphenidyl hydrochloride daily, increased gradually; usual maintenance dose 5 to 15 mg in 3 to 4 divided doses.

Synonym (4α,5α,17β)-4,5-Epoxy-3,17-dihydroxyandrost-2-ene-2-carbonitrile
Proprietary Name Modrenal

Chemical Properties Tan crystals. Mp 258° to 270°, with some decomposition. Practically insoluble in water, chloroform and ether; slightly soluble in a mixture of equal parts of chloroform and methanol. Log P (octanol/water) 2.0.

Thin-layer Chromatography System TA—R_f 0.88; system TB—R_f 0.00; system TC—R_f 0.18; system TD—R_f 0.30; system TE—R_f 0.07; system TF—R_f 0.45 (Marquis reagent, red; mercuric chloride-diphenylcarbazone, violet, fades to pink; acidified potassium permanganate solution, positive).

Gas Chromatography System GA—RI 3075, decomposition occurs.

Ultraviolet Spectrum Aqueous alkali—281 nm; ethanol—253 nm (A₁ = 234b).

Infrared Spectrum Principal peaks at wavenumbers 1665, 1060, 1050, 1320, 1205, 1180 cm⁻¹ (KBr disk).

Mass Spectrum Principal ions at m/z 41, 147, 79, 93, 55, 105, 67, 91.

Trilostane

Adrenocortical Suppressant

C₂₀H₂₇NO₃ = 329.4

CAS—13647-35-3

T

Quantification

Plasma HPLC For a method for the quantification of trilostane and ketotrilostane, see Powles *et al.* [1984]; Brown *et al.* [1995].

Dose 120 to 480 mg daily.

Brown RR *et al.* (1995). *J Chromatogr* 339: 440–444.

Powles P *et al.* (1984). Determination of trilostane and ketotrilostane in human plasma by high-performance liquid chromatography. *J Chromatogr* 311: 434–442.

Trimeperidine

Narcotic Analgesic

$C_{17}H_{25}NO_2 = 275.4$

CAS—64-39-1

IUPAC Name 1,2,5-Trimethyl-4-phenyl-4-piperidinol propanoate

Synonym Promedol.

Chemical Properties Soluble 1 in about 27 of water.

Trimeperidine Hydrochloride

$C_{17}H_{25}NO_2 \cdot HCl = 311.9$

CAS—125-80-4

Chemical Properties White crystalline powder. Freely soluble in water and chloroform; soluble in ethanol; practically insoluble in ether. Log *P* (octanol/water), 3.1.

Colour Test Marquis test—red-violet.

Thin-layer Chromatography System TA— R_f 0.58; system TAG— R_f 0.17; system TB— R_f 0.41; system TC— R_f 0.41 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, red-violet).

Gas Chromatography System GA—RI 1808; system GB—RI 1895.

High Performance Liquid Chromatography System HA—*k* 2.1.

Ultraviolet Spectrum Aqueous acid—251, 257 nm ($A_1^1 = 7.6b$), 263 nm. No alkaline shift.

Infrared Spectrum Principal peaks at wavenumbers 1738, 1181, 1141, 1162, 1195, 1077 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 186, 42, 201, 56, 57, 187, 202, 71.

Dose Trimeperidine hydrochloride has been given in doses of up to 200 mg daily.

Trimetaphan Camsilate

Antihypertensive

$C_{22}H_{25}N_2OS, C_{10}H_{15}O_4S = 596.8$

CAS—7187-66-8 (trimetaphan); 68-91-7 (camsilate)

Synonyms Decahydro-2-oxo-1,3-bis(phenylmethyl)thieno[1',2':1,2]thieno[3,4-*d*]imidazol-5-ium salt with (1*S*)-7,7-dimethyl-2-oxobicyclo[2,2,1]heptane-1-methanesulfonic acid (1:1); méthioplégium; trimetaphan camphorsulfonate; trimetaphan camsilate.

Proprietary Name Arfonad

Chemical Properties Colourless crystals or white crystalline powder. Mp about 245°, with decomposition. Soluble 1 in <5 of water and 1 in 2 of ethanol;

freely soluble in chloroform; slightly soluble in acetone and ether. Log *P* (octanol/water) 6.9.

Colour Tests Aromaticity (method 2)—colourless/yellow; Liebermann's reagent—orange.

Thin-layer Chromatography System TA— R_f 0.02; system TB— R_f 0.00; system TE— R_f 0.00; system TF— R_f 0.00; system TAE— R_f 0.00; system TAJ— R_f 0.00; system TAK— R_f 0.01; system TAL— R_f 0.20 (acidified iodoplatinate solution, positive).

High Performance Liquid Chromatography System HX—RI 386.

Ultraviolet Spectrum Aqueous acid—252 nm ($A_1^1=8.2a$), 258 nm ($A_1^1=8.3a$), 264 nm. No alkaline shift.

Infrared Spectrum Principal peaks at wavenumbers 1701, 1220, 1184, 1735, 1052, 1672 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 91, 65, 187, 92, 277, 259, 90, 273.

Dose Initially 3 to 4 mg/min by IV infusion.

Trimetazidine

Antianginal Vasodilator

$C_{14}H_{22}N_2O_3 = 266.3$

CAS—5011-34-7

IUPAC Name 1-[(2,3,4-Trimethoxyphenyl)methyl]piperazine

Synonym Trimetazine

Chemical Properties Log *P* (octanol/water), 0.6.

Trimetazidine Hydrochloride

$C_{14}H_{22}N_2O_3 \cdot 2HCl = 339.3$

CAS—13171-25-0

Proprietary Names *Cardiazidine*; *Centrophene*; *Idaptan*; *Oxygirex*; *Vastarel*; *Vastinol*.

Chemical Properties A white crystalline powder. Mp 225° to 228°. Freely soluble in water; sparingly soluble in ethanol.

Colour Tests Mandelin's test—violet; Marquis test—yellow (fades).

Thin-layer Chromatography System TA— R_f 0.22; system TB— R_f 0.05; system TC— R_f 0.04; system TL— R_f 0.01 (acidified iodoplatinate solution, positive).

High Performance Liquid Chromatography System HA— k 3.0 (tailing peak); system HAA—RT 6.1 min.

Ultraviolet Spectrum Aqueous acid—231 ($A_1^1 = 424$ a), 269 nm.

Infrared Spectrum Principal peaks at wavenumbers 1093, 1494, 1280, 1011, 1042, 1600 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 181, 85, 56, 166, 266, 182, 179, 91.

Quantification

Plasma HPLC Fluorescence detection. For method, see Courte and Bromet [1981].

Biological Fluids GC-MS For method, see Fay *et al.* [1989].

Dose Trimethadine hydrochloride has been given in doses of 40 to 60 mg daily.

Courte S, Bromet N (1981). Trace determination of trimethadine in plasma by high-performance liquid chromatography using fluorescence detection. *J Chromatogr* 224: 162-167.

Fay L *et al.* (1989). Determination of trimethadine in biological fluids by gas chromatography-mass spectrometry. *J Chromatogr* 490: 198-205.

Trimethadione

Anticonvulsant

$\text{C}_6\text{H}_9\text{NO}_3 = 143.1$

CAS—127-48-0

IUPAC Name 3,5,5-Trimethyl-1,3-oxazolidine-2,4-dione

Synonyms Trimetadiona; trimethadionum; trimethinum; troxidone.

Proprietary Names *Absentol*; *Epidione*; *Petidon*; *Ptimal*; *Tridione*.

Chemical Properties Colourless or white granular crystals. Mp 46°. Soluble 1 in 20 of water; freely soluble in ethanol, chloroform, benzene and ether. Log *P* (octanol/water), 0.6.

Thin-layer Chromatography System TE— R_f 0.00; system TF— R_f 0.00; system TAE— R_f 0.00.

Gas Chromatography System GA—trimethadione RI 1090, M (nor-) RI 1060; system GE—RRT 0.04 (relative to phenytoin).

High Performance Liquid Chromatography System HX—RI 286.

Infrared Spectrum Principal peaks at wavenumbers 1730, 1802, 1098, 1200, 770, 1295 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 43, 58, 143, 42, 41, 40, 39, 128.

Quantification

Plasma GC FID. For a method of quantification for trimethadione and dimethadione, see Bius *et al.* [1979].

Serum GC Limit of detection, 10 $\mu\text{g/L}$ for trimethadione, 50 $\mu\text{g/L}$ for dimethadione [Tanaka, Misawa 1992].

Disposition in the Body Readily absorbed after oral administration and extensively metabolised in the liver to the active metabolite, dimethadione, which is thought to be primarily responsible for the pharmacological activity. It is very slowly excreted in the urine over a period of several days, almost entirely in the form of dimethadione; the excretion of dimethadione is increased in alkaline urine.

Therapeutic Concentration Dimethadione attains plasma concentrations about 20 times greater than those of trimethadione and accumulates on chronic administration; there is considerable intersubject variation in plasma concentrations.

Steady-state plasma concentrations of 19 to 41 mg/L (mean, 25) of trimethadione and 350 to 1033 mg/L (mean, 550) of dimethadione were reported in 5 subjects during chronic treatment with trimethadione [Bius *et al.* 1979.]

Toxicity The estimated minimum lethal dose is 5 g. Toxic effects may be associated with plasma-dimethadione concentrations >1000 mg/L .

Half-life Plasma half-life, trimethadione about 16 h; dimethadione, half-life derived from urinary excretion data, 6 to 13 days.

Protein Binding Not significantly bound.

Dose Initially 900 mg daily, increasing to 1.8 g daily.

Bius DL *et al.* (1979). *Ther Drug Monit* 1: 495-505.

Trimethobenzamide

Antihistamine

$\text{C}_{21}\text{H}_{28}\text{N}_2\text{O}_5 = 388.5$

CAS—138-56-7

IUPAC Name *N*-[[4-(2-Dimethylaminoethoxy)phenyl]methyl]-3,4,5-trimethoxybenzamide

Chemical Properties pK_a 8.8. Log P (octanol/water), 2.3.

Trimethobenzamide Hydrochloride

$C_{21}H_{28}N_2O_5 \cdot HCl = 424.9$

CAS—554-92-7

Proprietary Names *Tebamide; T-Gen; Ticon; Tigan; Trimazide.*

Chemical Properties A white crystalline powder. Mp 188° to 190°. Soluble 1 in 2 of water, 1 in about 60 of ethanol, 1 in 67 of chloroform and 1 in 720 of ether.

Colour Tests Liebermann's reagent—black; Mandelin's test—violet-brown.

Thin-layer Chromatography System TA— R_f 0.42; system TB— R_f 0.02; system TE— R_f 0.47; system TAE— R_f 0.24 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 3281.

High Performance Liquid Chromatography System HA— k 4.7; system HX—RI 347.

Ultraviolet Spectrum Aqueous acid—258 nm ($A_1^1 = 312$ b). No alkaline shift.

Infrared Spectrum Principal peaks at wavenumbers 1123, 1230, 1575, 1505, 1616, 990 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 58, 195, 59, 72, 388, 89, 315, 42.

Quantification

Serum HPLC UV detection. For method, see Robert *et al.* [1982].

Saliva GC-MS Limit of detection, <100 $\mu g/L$ [Robert *et al.* 1981].

Disposition in the Body

Therapeutic Concentration

Following a single oral dose of 250 mg to 4 subjects, peak blood concentrations of 1.3 to 2.4 $\mu g/mL$ (mean, 1.7) were attained in 1.5 h [Baselt, Cravey 1977].

Toxicity

In a fatality involving the ingestion of trimethobenzamide, postmortem blood and bile concentrations of 184 mg/L and 1150 mg/L, respectively, were reported; a postmortem blood-alcohol concentration of 1100 mg/L was also reported [Harrill 1976].

Dose 0.75 to 1 g daily.

Baselt RC, Cravey RH (1977). *J Anal Toxicol* 1: 81–103.

Trimethoprim

Antimicrobial

$C_{14}H_{18}N_4O_3 = 290.3$

CAS—738-70-5

IUPAC Name 5-[(3,4,5-Trimethoxyphenyl)methyl]pyrimidine-2,4-diamine

Synonyms BW-56-72; NSC-106568; trimethoprimum; trimethoxyprim.

Proprietary Names *Ipral; Monotrim; Primsol; Proloprim; Tiempe; Trimogal; Trimopan; Trimplex; Uretrim; Wellcoprim.* It is an ingredient of *Bactrim, Borgal (vet.), Chemotrim, Cotrim, Fectrim, Laratrim, Polytrim, Septra, Septrin, SMZ-TMP, Sulfatrimand Trivetrim (vet.).*

Chemical Properties White or yellowish-white crystals or crystalline powder. Mp 199° to 203°. Soluble 1 in 2500 of water, 1 in 300 of ethanol, 1 in 55 of chloroform and 1 in 80 of methanol; practically insoluble in ether. pK_a 7.2; 6.6. Log P (octanol/water), 0.91.

Colour Tests Aromaticity (method 2)—yellow/red; Mandelin's test—yellow-brown; Marquis test—orange; nitric acid, cold—red, which fades to yellow on heating.

Thin-layer Chromatography System TA— R_f 0.55; system TB— R_f 0.00; system TC— R_f 0.22; system TE— R_f 0.45; system TL— R_f 0.12; system TAD— R_f 0.20; system TAE— R_f 0.45; system TAF— R_f 0.59; system TAJ— R_f 0.14; system TAK— R_f 0.08; system TAL— R_f 0.66 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—trimethoprim RI 2558, trimethoprim- AC_2 RI 3000.

High Performance Liquid Chromatography System HA— k 1.2; system HX—RI 299; system HY—RI 254; system HZ—retention time 2.1 min; system HAA—retention time 8.3 min; system HAX—retention time 6.7 min; system HAY—retention time 3.7 min.

Ultraviolet Spectrum Aqueous acid—271 nm ($A_1^1 = 218a$); aqueous alkali—287 nm ($A_1^1 = 250a$).

Infrared Spectrum Principal peaks at wavenumbers 1126, 1630, 1596, 1235, 1650, 1565 cm^{-1} (KBr disk).

Quantification

Tissues HPLC-MS SIM: m/z 291. Limit of detection, 4 $\mu g/kg$ [Cannavan *et al.* 1997].

Disposition in the Body Readily and rapidly absorbed after oral administration. Trimethoprim is widely distributed around the body to tissues and fluids including kidneys, liver, lung and bronchial secretions, saliva, aqueous humour and vaginal secretions. Metabolic reactions include oxidation of the methylene

group to a hydroxymethyl group, *N*-oxidation, *O*-demethylation, hydroxylation and conjugation with glucuronic acid or sulfate. 10 to 20% of a dose is metabolised. Metabolites are excreted in the urine as conjugates but the greater part of the dose is excreted as unchanged drug. Urinary excretion is pH-dependent and is increased in acid urine. About 40 to 75% of a dose is excreted in 24 h, up to 60% being in the form of unchanged drug, with about 4% each as the 3'-hydroxymethyl and 4'-hydroxymethyl metabolites, and 2% as the *N*¹-oxide. <4% is eliminated in the faeces. It readily crosses the placenta and has been detected in breast milk.

Therapeutic Concentration The serum therapeutic concentration ranges from 1.5 to 2.5 mg/L.

Following oral administration of 300 mg once daily to 6 subjects, maximum steady-state plasma concentrations of 3.1 to 9.5 mg/L (mean, 6.0) were attained in 1 to 4 h (mean, 2) [Odland *et al.* 1984].

For further references to trimethoprim when administered with sulfamethoxazole, see under Sulfamethoxazole.

Toxicity Toxic effects have been associated with plasma concentrations >20 mg/L. Bone marrow depression may result owing to the administration of high doses of trimethoprim or use for extended periods of time.

A 28-year-old man ingested 8 g of trimethoprim and 14 h later the plasma concentration was 19.6 mg/L. It was estimated that the actual amount of trimethoprim absorbed was about 3 g. The patient subsequently recovered [Hopppu *et al.* 1980].

Half-life Plasma half-life, 8 to 17 h (mean, 11).

Volume of Distribution About 1.4 L/kg.

Clearance Plasma clearance, about 2 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, about 0.78.

Saliva Plasma : saliva ratio, about 1.3.

Protein Binding 40 to 70%.

Note For a review of the clinical pharmacokinetics of sulfamethoxazole and trimethoprim, see Patel and Welling [1980].

Dose Doses of 1.5 g daily for 3 days have been given for malaria. For acute infection (oral): adults, 100 to 200 mg twice daily or a 100 to 300 mg single dose; children, 6 to 8 mg/kg daily; (6 to 12 years old) 100 mg twice daily; (6 months to 5 years old) 50 mg twice daily; (6 weeks to 5 months) 25 mg twice daily. (IV): 200 mg every 12 h (adults); 6 to 9 mg/kg daily (children).

Trimethoxyamphetamine

Hallucinogen, Phenethylamine

$C_{12}H_{19}NO_3 = 225.3$

CAS—1082-88-8

IUPAC Name 1-(3,4,5-Trimethoxyphenyl)propan-2-amine

Synonym α -Methyl-3,4,5-trimethoxyphenethylamine; trimethoxyamphetamine.

Chemical Properties Trimethoxyamphetamine is the α -methyl homologue of mescaline. An oil. Practically insoluble in water; soluble in chloroform. The hydrochloride is soluble in water. Mp 219° to 220°. Log *P* (octanol/water), 1.2. Extraction yield (chlorobutane), 0.5 (2,4,6-TMA), 0.2 (2,4,5-TMA) [Demme *et al.* 2005].

Colour Test Marquis test—orange.

Thin-layer Chromatography System TA—(2,4,6-TMA) *R_f* 0.33; system TB—(2,4,6-TMA) *R_f* 0.06; system TC—(2,4,6-TMA) *R_f* 0.11; system TE—(2,4,6-TMA) *R_f* 0.29; system TAE—(2,4,6-TMA) *R_f* 0.07; system TAF—(2,4,6-TMA) *R_f* 0.70; system TAG—(2,4,6-TMA) *R_f* 0.12 (acidified iodoplatinate solution—positive).

Gas Chromatography System GA—RI 1748.

High Performance Liquid Chromatography System HC—*k* 1.48; system HX—(2,4,6-TMA) RI 290; system HY—(3,4,5-TMA) RI 232, (2,4,6-TMA) RI 298.

Ultraviolet Spectrum Aqueous acid—269 nm (*A*₁¹ = 26 b). No alkaline shift.

Infrared Spectrum Principal peaks at wavenumbers 1130, 1595, 1510, 1240, 1000, 1151 cm⁻¹ (KBr disk).

Mass Spectrum Principal ions at *m/z* 43, 182, 167, 225, 181, 183, 151, 142.

Demme U *et al.* (2005). Systemic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. In *Proceedings of the 12th Annual Meeting of the International Association of Forensic Toxicologists*, Seoul: 481-486.

Trimetozine

Tranquilliser

$C_{14}H_{19}NO_5 = 281.3$

CAS—635-41-6

IUPAC Name 4-(3,4,5-Trimethoxybenzoyl)morpholine

Synonyms Trimethoxazine; trimolide.

Proprietary Names *Opalene*; *Trioxazine*.

Chemical Properties White crystalline powder. Mp ≈120° to 122°. Slightly soluble in water and ethanol; freely soluble in chloroform and methanol. Log *P* (octanol/water) —0.2.

Colour Tests Liebermann's reagent—black; Marquis test—red-brown.

Thin-layer Chromatography System TA—*R_f* 0.61; system TAE—*R_f* 0.80; system TAG—*R_f* 0.52; system TB—*R_f* 0.11; system TC—*R_f* 0.72; system TE—*R_f* 0.68 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2253.

Ultraviolet Spectrum Methanol—245 nm (*A*₁¹ = 259b).

Infrared Spectrum Principal peaks at wavenumbers 1131, 1642, 1229, 1110, 1592, 1001 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 195, 281, 196, 152, 280, 81, 77, 66.

Dose Usually 0.6 to 1.8 g daily; maximum of 3 g daily.

Trimetrexate

Antineoplastic, Dihydrofolate Reductase Inhibitor

$\text{C}_{19}\text{H}_{23}\text{N}_5\text{O}_3 = 369.4$

CAS—52128-35-5

IUPAC Name 5-Methyl-6-[(3,4,5-trimethoxyanilino)methyl]quinazoline-2,4-diamine

Synonyms CI-898; JB-11; NSC-249008.

Chemical Properties Mp 215° to 217°. It is practically insoluble in water (>0.1 g/L).

Trimetrexate D-Glucuronate

$\text{C}_{25}\text{H}_{33}\text{N}_5\text{O}_{10} = 563.6$

CAS—82952-64-5

Synonyms 2,4-diamino-5-methyl-6-[(3,4,5-trimethoxyanilino)methyl]quinazoline mono-*D*-glucuronate; NSC-352122; trimetrexate *D*-glucuronate; *D*-glucuronic acid compound with 5-methyl-6-[(3,4,5-trimethoxyphenyl)amino)methyl].

Proprietary Names *NeuTrexin*; *Oncotrex*.

Chemical Properties A pale greenish to yellow powder or cake. It is soluble in water (>50 g/L). pK_a (50% methanol/water), 8.0. Log *P* (octanol/water), 1.63, 2.55.

Mass Spectrum

Quantification

Blood HPLC Column: Ultrasphere ODS (250 × 4.6 mm i.d., 5 μm). Mobile phase: 50 mmol/L sodium monobasic monohydrate containing 17% acetonitrile and 0.8% acetic acid (pH 5.5), flow rate 1.0 mL/min. UV detection ($\lambda = 254$ nm). Limit of quantification, 0.02 μg/L [Lin *et al.* 1987]. Column: Spherisorb-ODS (100 × 4.6 mm i.d., 5 μm). Mobile phase: 0.04% phosphoric acid–0.08% triethylamine:acetonitrile (85:15 to 60:40 over 10 min), flow rate 1.5 mL/min. DAD ($\lambda = 241$ nm). Limit of quantification, 100 μg/L [Hudes *et al.* 1989]. Column: Zorbax TMS (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: 50 mmol/L ammonium phosphate containing 0.8% triethylamine and 0.2% phosphoric acid (pH 4.5), flow rate 1.2 mL/min. UV detection ($\lambda = 241$ nm). Limit of detection, 2.4 μg/L [Bullen *et al.* 1990].

Plasma GC-MS Column: fused silica (5000 × 0.32 mm i.d., 0.17 mm). Carrier gas: He, 1.0 mL/min. Temperature programme: 200° for 0.1 min to 300° at 15°/min. EI ionisation, SIM acquisition mode [Stetson, Ensminger 1986].

HPLC Column: HP RPC₁₈ ODS (100 × 4.6 mm i.d., 5 μm). Mobile phase: water containing 0.16% trimethylamine and 0.08% phosphoric acid: acetonitrile (91:9 to 65:35 over 15 min). DAD ($\lambda = 241$ nm). Limit of detection, 0.1 mg/L [Hudes *et al.* 1991].

Urine HPLC See Plasma [Hudes *et al.* 1991]. Column: Spherisorb ODS (100 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile:0.08% triethylamine (15:85 to 40:60 over 10 min), flow rate 1.5 mL/min. UV detection ($\lambda = 241$ nm). Limit of detection, 100 μg/L [Tinsley, LaCreta 1990]. See Blood [Hudes *et al.* 1989]. See Blood. Limit of quantification, 0.05 μg/L [Lin *et al.* 1987].

Faeces HPLC See Blood. Limit of quantification, 0.05 μg/L [Lin *et al.* 1987].

Disposition in the Body Metabolism has not been characterised in humans for trimetrexate. However, pre-clinical data suggest that the major metabolic pathway is oxidative *O*-demethylation, followed by conjugation to either its glucuronide or the sulfate. *N*-Demethylation and oxidation are related minor pathways. Preliminary findings in humans indicate the presence of a glucuronide conjugate with dihydrofolate reductase inhibition and a demethylated metabolite in urine. Trimetrexate is extensively metabolised by the liver and eliminated by hepatic metabolism via the cytochrome P450 system. At least 2 metabolites are active and 2 are conjugated with glucuronic acid. Hepatic degradation may account for the low and variable oral absorption. Approximately 50% of dose is excreted in urine, with 10–30% as the unchanged drug, and 0.1–8% in faeces.

Therapeutic Concentration

Forty-nine adult patients with AIDS and *Pneumocystis jiroveci* (was *P. carinii*) pneumonia (in combination with calcium folinate) were administered with 30 mg/m² trimetrexate for 21 days. Peak plasma concentrations of 4.4 mg/L were observed by the end of infusion [Allegra *et al.* 1987].

Six adult patients with AIDS and *P. jiroveci* pneumonia were administered with 30 mg/m² trimetrexate daily (in combination with calcium folinate) for 21 days. Peak plasma concentrations of 3.1 mg/L trimetrexate were detected. A dose of 60 mg/m² daily for 3 days produced peak concentrations of 1.2 mg/L [Rogers *et al.* 1988].

A child with AIDS and *P. jiroveci* pneumonia was administered with a 30 mg/m² dose of trimetrexate daily for 21 days. A peak plasma concentration of 8 mg/L was reached [Smit *et al.* 1990].

Toxicity Administration without concurrent leucovorin (folinic acid) can cause lethal complications.

Half-life 11–16.4 h.

Bioavailability Mean oral bioavailability, 44% (range, 19–67%).

Volume of Distribution Plasma, 0.17 L/kg; steady state, 0.62 L/kg (20 L/m²); steady state in AIDS patients, 11–20 L/m²; in cancer patients, 12–42 L/m².

Clearance Plasma clearance, 53 mL/min.

Protein Binding >97%.

Dose Trimetrexate daily 45 mg/m² (with folinic acid).

Trimipramine

Antidepressant

$\text{C}_{20}\text{H}_{26}\text{N}_2 = 294.4$

CAS—739-71-9

IUPAC Name 10,11-Dihydro-*N,N*, β -trimethyl-5*H*-dibenz[*b,f*]azepine-5-prop-*anamine*

Synonyms IL-6001; 7162-R; trimiprimine; trimepropramine.

Proprietary Name *Tydamine*

Chemical Properties Pale yellowish-white waxy solid. Mp 45°. Practically insoluble in water; readily soluble in ethanol. pKa 7.7 [Baselt 2008]. Log *P* (octanol/water), 5.43. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Plasma samples were stable for several months at -20° [Bougerolle *et al.* 1988; Gulaid *et al.* 1991].

Trimipramine Maleate

C₂₀H₂₆N₂·C₄H₄O₄ = 410.5

CAS—521-78-8

Synonym Trimipramine hydrogen maleate

Proprietary Names *Apo-Trimip*; *Herphonal*; *Novo-Tripamine*; *Rhotrimine*; *Stangyl*; *Surmontil*; *Tripres*.

Chemical Properties White to almost-white crystalline powder. Mp 142°. Slightly soluble in water and ethanol; soluble in chloroform; practically insoluble in ether.

Colour Tests Forrester reagent—blue; FPN reagent—blue; Mandelin's test (add water)—blue.

Thin-layer Chromatography System TA—R_f 0.59; system TB—R_f 0.62; system TC—R_f 0.54; system TE—R_f 0.80; system TL—R_f 0.37; system TAE—R_f 0.36; system TAF—R_f 0.56 (acidified iodoplatinate solution, positive).

Column: Chiralcel OD-R (250 × 4.6 mm i.d., 10 μm). Mobile phase: 0.3 mol/L aqueous sodium perchlorate: acetonitrile (58:42), flow rate 0.5 mL/min. UV detection (λ = 210 nm). *k* values (RTs): *R*-trimipramine, 2.41 (19.6 min); *S*-trimipramine, 2.87 (22.3 min) [Liu, Stewart 1997].

Ultraviolet Spectrum Aqueous acid—250 nm (A₁¹ = 300a)

Infrared Spectrum Principal peaks at wavenumbers 1490, 762, 1240, 1230, 741, 749 (KBr disk).

Mass Spectrum Principal ions at *m/z* 58, 249, 208, 99, 193, 234, 84, 248.

Quantification

Blood GC Column: DB-1 (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 4 mL/min. Temperature programme: 100° for 1 min to 300° at 30°/min. FID. Limit of detection, 32 μg/L [Lee *et al.* 1997]. Column: 3% SP2100 mesh supelcoport 100/120 mesh (1.8 m × 2 mm i.d.). Carrier gas: N₂, 25 mL/min. Temperature programme: 170° to 275° at 8°/min for 5 min. FID. Limit of detection not reported [Meatherall *et al.* 1983]. Column: 3% OV-101 on Chromosorb WHP 80/100 mesh (1.2 m × 2 mm i.d.). Carrier gas: N₂, 30 mL/min. Temperature programme: 190° for 2 min to 240° at 20°/min for 5 min. FID. Limit of detection, 0.5 mg/L [Wu Chen *et al.* 1983].

HPLC Column: RP-8 (250 × 4.6 mm i.d., 5 μm). Mobile phase: 0.01 mol/L potassium dihydrogen phosphate: acetonitrile: *n*-nonylamine (pH 3.2, 550:450:0.6), flow rate 1.6 mL/min. UV detection (λ = 205 nm). Retention time: ≈7 min. Limit of detection not reported [Fraser *et al.* 1987].

Plasma GC Column: DB-17 (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: N₂, 0.7 mL/min. Temperature programme: 140° to 220° at 20°/min to 270° at 2°/min. NPD, EI ionisation, SIM acquisition mode. Retention time: 16.3 min. Limit of quantification, 125 μg/L [Ulrich, Martens 1997]. NPD. Limit of detection, 3 μg/L for trimipramine and 4 μg/L for desmethyltrimipramine and hydroxytrimipramine [Jourdil *et al.* 1993]. Column: 3% SP-2250 on 80/100 Supelcoport (6' × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 230°. NPD. Retention time: 4.14 min. Limit of detection, 0.5 μg/L [Abernethy *et al.* 1984].

GC-MS Column: DB-5MS fused silica capillary (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 2.0 mL/min. Temperature programme: 100° for 1 min to 300° at 20°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 5 μg/L, limit of detection, 2.0 μg/L [Lee *et al.* 2008]. Column: SE-54 (12 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 60 mL/min. Temperature programme: 160° to 260° at 30°/min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 3.11 min. Limit of quantification, 4 μg/L for trimipramine and 2 μg/L for desmethyltrimipramine, limit of detection, 1 μg/L [Eap *et al.* 1994]. Column: SE 30 (25 m × 0.25 mm i.d.). Carrier gas: He. Temperature programme: 80° for 1 min to 270° at 30°/min. EI ionisation. Retention time: 9.62 min. Limit of detection, 1 μg/L [Bougerolle *et al.* 1988].

HPLC Column: Spherisorb (25 cm × 4.6 mm i.d., 5 μm). Mobile phase: dipotassium hydrogen orthophosphate (pH 6.5): methanol: acetonitrile (1:1:1), flow rate, 1.0 mL/min. Electrochemical detection. Limit of quantification, 1 μg/L [Gulaid *et al.* 1991]. Column: trimethyl silyl (25 cm × 4.6 mm i.d., 5 μm). Mobile phase: 0.05 mol/L monobasic potassium phosphate: acetonitrile (65:35) plus 1.2 mL/L *n*-butylamine and 1.0 mL/L phosphoric acid, flow rate 1.5 mL/min. Electrochemical detection. Limit of quantification, ≈3 μg/L [Suckow, Cooper 1984]. Column: μBondapak CN (30 cm × 3.9 mm i.d., 10 μm). Mobile phase: acetonitrile: methanol: phosphate buffer (pH 7.0, 625:155:220), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Retention time: 3.59 min. Limit of detection, 2 μg/L [Visser *et al.* 1984].

Serum GC Column: 1.4% Carbowax 20M and 1.4% KOH on Gas-Chrom Q 60/80 mesh (2 m × 2 mm i.d.). Carrier gas: N₂, 35 mL/min. Temperature: 200°. Relative retention time: 0.44. Limit of detection not reported [Nyberg, Martensson 1977].

HPLC Column: LiChrospher 100 CN. Mobile phase: 5 mmol/L sodium phosphate buffer (pH 6.0):methanol:acetonitrile (22:32:46), flow rate 1.5 mL/min. UV detection ($\lambda=250$ nm). Limit of quantification, 1 μ g/L [Kirchheiner *et al.* 2003]. UV detection ($\lambda=210$ nm). Limit of quantification, 15 μ g/L, limit of detection, 10 μ g/L [Liu, Stewart 1997]. Column: μ Bondapak C₁₈ (30 cm \times 3.9 mm i.d., 10 μ m). Mobile phase: acetonitrile:0.025 mol/L potassium dihydrogen phosphate:water (45:50:5), flow rate 1.0 mL/min. UV detection ($\lambda=254$ nm). Retention time: 10.1 min. Limit of detection, 4–5 μ g/L [Pok Phak *et al.* 1986].

Red Blood Cells GC See Plasma [Jourdil *et al.* 1993].

Urine GC-MS Column: HP capillary (12 m \times 0.2 mm i.d., 0.33 μ m). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 10°/min for 5 min. EI ionisation, scan mode. Limit of detection not reported [Maurer 1989]. Column: SE-54 (25 m \times 0.32 mm i.d.). Temperature programme: 75° to 300° at 25°. EI ionisation at 70 eV, CI. Limit of detection not reported [Köppel, Tenczer 1988].

HPLC See Serum. Mobile phase: 5 mmol/L sodium phosphate buffer (pH 6.0):methanol:acetonitrile (25:32:43), flow rate 0.8 mL/min [Kirchheiner *et al.* 2003]. See Blood [Fraser *et al.* 1987].

Hair LC-MS Column: Luna C₁₈ (15 cm \times 4.6 mm i.d.). Mobile phase: 0.02 mol/L ammonium acetate and 0.1% acetic acid in water:acetonitrile (35:65), flow rate 0.5 mL/min. ESI. Limit of detection, 20 nmol/L [McClean *et al.* 2000].

Liver HPLC See Blood [Fraser *et al.* 1987].

Disposition in the Body Readily absorbed after oral administration but undergoes considerable first-pass metabolism to the active metabolite, *N*-monodesmethyltrimipramine; bioavailability ~40% with wide inter-subject variation. Didesmethyltrimipramine, 2-hydroxytrimipramine and 2-hydroxydesmethyltrimipramine have also been detected as metabolites. Demethylation is catalysed not only by CYP2C9 and CYP2C19 but also CYP1A2 and CYP3A4 [Kirchheiner *et al.* 2003]. Excreted in the urine mainly as metabolites.

Therapeutic Concentration

A single oral dose of 50 mg administered to 9 subjects, resulted in peak plasma concentrations of 15–51 μ g/L (mean 28) in 1–6 h [Abernethy *et al.* 1984].

After daily oral doses of 75 or 150 mg to 29 subjects, the following steady-state plasma concentrations were reported: trimipramine 11–241 μ g/L (mean 86), *N*-monodesmethyltrimipramine 3–382 μ g/L (mean 65), 2-hydroxytrimipramine 3–40 μ g/L (mean 16), and 2-hydroxy-*N*-monodesmethyltrimipramine 3–49 μ g/L (mean 17) [Suckow, Cooper 1984].

Ten patients receiving 75 mg of trimipramine daily had a mean steady-state plasma concentration of 53.8 μ g/L trimipramine and 26.3 μ g/L desmethyltrimipramine, whereas 10 others receiving 150 mg daily had a mean concentration of 122.5 μ g/L trimipramine and 133.8 μ g/L desmethyltrimipramine, representing a markedly disproportionate increase [Musa 1989].

After a single oral dose of 50 mg to a healthy volunteer the maximum plasma concentration was 16 μ g/L at 3–4 h [Gulaid *et al.* 1991].

Toxicity Toxic effects have been associated with plasma concentrations >1 mg/L, serum concentrations >0.5 mg/L. A lethal serum concentration of 8.7 mg/L has been noted.

In a fatality involving the ingestion of up to 6 g of trimipramine, the following postmortem tissue concentrations were reported: blood 9.5 mg/L, brain 27 μ g/g, kidney 42 μ g/g, liver 224 μ g/g, spleen 31 μ g/g [Rousseau, Rousseau 1970].

In a fatality involving the ingestion of trimipramine and clomipramine, postmortem concentrations were: blood, trimipramine 12 (11.6) mg/L, clomipramine 2.1 mg/L; liver, trimipramine 544 μ g/g, clomipramine 56 μ g/g [Hucker 1983].

A 25-year-old was found dead in his kitchen. The trimipramine and its metabolites were found at postmortem as shown below.

	Blood (mg/L)	Urine (mg/L)	Liver (mg/kg)
Trimipramine	4.8	0.58	51
Desmethyltrimipramine	2.1	0.1	16
2-OH trimipramine	-	0.1	1.5
2-OH desmethyltrimipramine	-	0.09	1.1
Ethyl alcohol	200	1500	-
Gastric contents	Trimipramine positive		
Vitreous humour	Ethylalcohol 450 mg/L		

[Fraser *et al.* 1987]

Investigation into the death of a 53-year-old female concluded that she had taken an acute (suicidal) overdose of trimipramine and citalopram. Post-mortem revealed the tissue concentrations (in mg/L or μ g/kg; TM = trimipramine; DTM = desmethyltrimipramine; CP = citalopram; DCP = desmethylcitalopram) shown in the table above.

	TM	DTM	CP	DCP
Heart blood	11.81	4.07	4.82	2.30
Femoral blood	2.33	1.13	4.81	2.45
Liver	38.35	12.06	11.89	5.89
Kidney	30.57	-	13.34	-
Urine	8.46	-	13.00	-
Brain	10.39	-	1.98	-
Bile	-	-	3.31	-

Zolpidem was also detected (0.07 mg/L in heart blood, 1.12 mg/L in femoral blood, 0.19 μ g/g in the kidney) [Musshoff *et al.* 1999].

Half-life Plasma half-life, 16–40 h (mean 24).

Volume of Distribution \approx 20–50 L/kg (mean 30).

Clearance Plasma clearance, 10–25 mL/min/kg (mean 16).

Distribution in Blood Plasma: whole blood ratio, 1.2.

Protein Binding \approx 94%.

Dose Initially, 50 to 75 mg trimipramine daily; increased as necessary to 150 to 300 mg. In the elderly, 10 to 25 mg is administered initially and increased as necessary. (In the USA, initially 50 mg is administered and a maximum of 100 mg to the elderly).

Trioxysalen

Pigmenting Agent

C₁₄H₁₂O₃ = 228.2

CAS—3902-71-4

IUPAC Name 2,5,9-Trimethylfuro[3,2-g]chromen-7-one

Synonyms 2,5,9-Trimethyl-7H-furo[3,2-g][1]benzopyran-7-one; 4,5',8-trimethylpsoralen; trioxsalen.

Proprietary Names *Puvadin*; *Tripsor*; *Trisoralen*.

Chemical Properties A white or greyish crystalline solid. Mp about 230°. Practically insoluble in water; soluble 1 in 1150 of ethanol, 1 in 84 of chloroform and 1 in 43 of methylene chloride. Log *P* (octanol/water), 3.7.

Gas Chromatography System GA—RI 2155.

Ultraviolet Spectrum Methanol—248 (A₁¹=981b), 296 (A₁¹=428b), 338 nm (A₁¹=276b).

Infrared Spectrum Principal peaks at wavenumbers 1710, 1600, 1110, 880, 930, 1620 cm⁻¹ (Nujol mull).

Mass Spectrum Principal ions at *m/z* 228, 200, 199, 128, 229, 185, 115, 201.

Quantification

Blood GC-MS For method, see Ros *et al.* [1988].

Tripeleppamine

Antihistamine

C₁₆H₂₁N₃ = 255.4

CAS—91-81-6

IUPAC Name *N*-Benzyl-*N,N'*-dimethyl-*N*-pyridin-2-ylethane-1,2-diamine

Synonym *N,N*-Dimethyl-*N'*-(phenylmethyl)-*N*-2-pyridinyl-1,2-ethanediamine

Chemical Properties An oily liquid. Miscible with water. pK_a 4.2, 8.71 [Martínez-Algaba *et al.* 2006], 3.9, 9.0(25°). Log *P* (octanol/water), 2.85 [Martínez-Algaba *et al.* 2006], 2.7.

Tripeleppamine Citrate

C₁₆H₂₁N₃·C₆H₈O₇ = 447.5

CAS—6138-56-3

Proprietary Name *PBZ* (elixir)

Chemical Properties A white crystalline powder. Mp 106° to 110°. Freely soluble in water and ethanol; practically insoluble in benzene and chloroform; very slightly soluble in ether.

Tripeleppamine Hydrochloride

C₁₆H₂₁N₃·HCl = 291.8

CAS—154-69-8

Proprietary Names *Azaron*; *Etono*; *Fenistil*; *PBZ* (tablets); *Pyribenzamine*; *Vaginex*.

Chemical Properties A white crystalline powder which slowly darkens on exposure to light. Mp 192° to 193°. Soluble 1 in approx. 0.8 of water, 1 in 6 of ethanol, 1 in 6 of chloroform and 1 in ~350 of acetone; practically insoluble in ether and benzene.

Colour Tests Cyanogen bromide—yellow; Liebermann's reagent—orange→brown; Mandelin's test—yellow-brown; Marquis test—red-brown.

Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.44; system TC—R_f 0.27; system TE—R_f 0.68; system TL—R_f 0.15; system TAE—R_f 0.22; system TAF—R_f 0.34 (Dragendorff spray—positive; acidified iodoplatinate solution—positive; Marquis test—brown).

Gas Chromatography System GA—tripeleppamine RI 1976, M (OH-) RI 2400, M (OH-)(-AC) RI 2390, M (benzylpyridylamine) RI 1650, M (nor-) RI 2420, M (nor-)(-AC) RI 2420, M (nor-OH-)(-AC) RI 2860.

High Performance Liquid Chromatography System HA—*k* 3.6; system HX—RI 336; system HY—RI 265.

Column: Spherisorb ODS (250 × 4.6 mm i.d., 5 μm). Mobile phase: 0.04 mol/L CTAB:butan-1-ol (pH 3.0, 90:10), flow rate 1.0 mL/min. UV detection (λ = 240 nm). Limit of detection, 0.3 mg/L [Martínez-Algaba *et al.* 2006]. Column: ODS-2

(120 × 4.6 mm i.d., 5 m). Mobile phase: methanol: water (60:40). UV detection (λ = 285 nm). Retention time: 2.1 min. Limit of detection, 40 μg/L [Gil-Agusti *et al.* 2001].

Ultraviolet Spectrum Aqueous acid—239 nm (A₁¹ = 562a), 314 nm; aqueous alkali—249, 312 nm.

Infrared Spectrum Principal peaks at wavenumbers 1496, 1592, 770, 1250, 955, 735 cm⁻¹ (tripeleppamine hydrochloride, KBr disk).

Mass Spectrum Principal ions at *m/z* 58, 91, 72, 71, 197, 185, 184, 92.

Quantification

Blood GC FID [Monforte *et al.* 1983]. Column: 3% OV-17 on Chromosorb W HP 80/100 mesh (1.8 m × 4 mm i.d.). Carrier gas: N₂, 30 mL/min. Temperature: 220°. AFID. Retention time: 6.9 min. Limit of detection, 0.1 mg/L [Mackell, Poklis 1982]. Column: 3% OV-17 Gas-Chrom W HP (6 ft). Carrier gas: He, 50 psi. Temperature programme: 115° for 3 min to 260° at 16°/min for 12 min. FID. Retention time: 0.72 min. Limit of detection not reported [Bayley *et al.* 1975].

Plasma GC Column: 3% OV-17 on 120/140 mesh GasChrom Q (1.8 m × 2 mm i.d.). Carrier gas: N₂, 30 mL/min. Temperature programme: 190° to 260° at 10°/min. TID. Limit of detection, 5 μg/L [Yeh *et al.* 1986].

Urine GC Column: 3% OV-17 on 120/140 mesh GasChrom Q (180 cm × 2 mm i.d.). Temperature programme: 190° to 250° at 10°/min. NPD. Retention time: 3.1 min. Limit of detection, 0.5 mg/L [Yeh 1991]. Column: 3% OV-17 on Gas-Chrom Q 80/100 mesh (1.8 m × 2 mm i.d.). Carrier gas: CH₄, 30 mL/min. Temperature programme: 150° to 250° at 10°/min. FID. Limit of detection, not reported [Reid, Gerbeck 1981]. See Blood [Bayley *et al.* 1975].

HPLC Column: (250 × 4.6 mm i.d.). Mobile phase: 0.005 mol/L tetraethylammonium in dichloromethane: propan-2-ol (99:1), flow rate 2.0 mL/min. Fluorescence detection ($\lambda_{\text{ex}}=310$ nm, $\lambda_{\text{em}}=360$ nm). Retention time: 7.4 min. Limit of detection, 10 ng/g [Thompson *et al.* 1983]

Gastric Contents GC See Blood [Bayley *et al.* 1975].

Kidney GC See Blood [Bayley *et al.* 1975; Monforte *et al.* 1983].

Liver GC See Blood [Bayley *et al.* 1975; Monforte *et al.* 1983].

Other GC Bovine Milk. Column: borosilicate 100/120 GasChrom S (2.4 m × 4 mm i.d.). Carrier gas: N₂, 60 mL/min. Temperature: 218°. Limit of detection, 10 ppb [Luders *et al.* 1970].

HPLC Bovine Plasma and Milk. Column: 3CN (100 × 4.6 mm i.d.). Mobile phase: water: acetonitrile-0.05 mol/L acetate buffer (pH 7.2, 70:30), flow rate 0.8 mL/min. UV detection ($\lambda=246$ nm). Limit of detection, 2 µg/L [Dadgar, Power 1987].

Disposition in the Body Tripeleminamine is rapidly absorbed after oral administration. It is metabolised by ring hydroxylation and demethylation, followed by conjugation with glucuronic acid. It is excreted in the urine, mainly as metabolites, and in the bile, and it appears to undergo enterohepatic circulation. The major urinary metabolites are tripeleminamine-*N*-glucuronide, conjugated hydroxytri-peleminamine and the conjugated hydroxydesmethyl metabolite; the *N*-oxide is a minor metabolite.

Therapeutic Concentration After a single oral dose of 100 mg, a peak plasma concentration of 0.06 mg/L was reported to have been attained in 2–3 h [Bayley *et al.* 1975].

Toxicity

Fatal intracranial haemorrhage occurred in a 30-year-old man following IV abuse of pentazocine and tripeleminamine (~125 mg of each was injected over the 6 h before admission) together with oral phenylpropranolamine (a 75 mg extended-release preparation was taken 20 h before onset of neurological symptoms); gastric aspirate at admission contained pentazocine 8.2 mg/L and tripeleminamine 2.0 mg/L [Jackson *et al.* 1985].

In a fatality arising from the ingestion of ~1 g, in which death occurred ~7 h after ingestion, the following postmortem tissue distribution was reported: blood 10 mg/L, brain 43 µg/g, kidney 35 µg/g, liver 83 µg/g and urine 287 mg/L [Bayley *et al.* 1975].

In 17 fatalities involving the IV abuse of tripeleminamine and pentazocine, tripeleminamine blood concentrations of 0 to 3.0 mg/L (mean 0.5) were reported; kidney concentrations of 0.4 to 2.0 µg/g (mean 1.1) were reported in 4 subjects and liver concentrations of 1.0–6.5 µg/g (mean 3.1 µg/g) in 5 subjects; pentazocine blood concentrations ranged from 0 to 11 mg/L (mean 3 mg/L) [Monforte *et al.* 1983].

Dose Tripeleminamine hydrochloride 25 to 50 mg every 4 to 6 h; up to 600 mg daily has been given.

Chemical Properties A white crystalline powder which turns yellow on exposure to light. Mp 243°, with decomposition. Soluble in water, ethanol and acetone; insoluble in ether. Log *P* (octanol/water), –2.4.

Colour Tests Liebermann's reagent—red-orange; Mandelin's test—blue (slow).

Thin-layer Chromatography System TA—R_f 0.61 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—246 nm ($A_1^1=680b$).

Infrared Spectrum Principal peaks at wavenumbers 691, 769, 1529, 720, 1164, 998 cm⁻¹ (KBr disk).

Tripolidine

Antihistamine

C₁₉H₂₂N₂ = 278.4

CAS—486-12-4

IUPAC Name 2-[(*E*)-1-(4-Methylphenyl)-3-pyrrolidin-1-ylprop-1-enyl]pyridine

Chemical Properties Crystals. Mp 59° to 61°. pK_a 6.5. Log *P* (octanol/water), 3.9.

Tripolidine Hydrochloride

C₁₉H₂₂N₂·HCl, H₂O = 332.9

CAS—550-70-9 (anhydrous); 6138-79-0 (monohydrate)

Proprietary Names *Actidil*; *Actidilon*; *Myidyl*; *Pro-Actidil*. It is an ingredient of *Actifed*.

Chemical Properties A white crystalline powder. Mp 116° to 118°. Soluble 1 in about 2 of water, 1 in about 1.5 of ethanol, 1 in <1 of chloroform and 1 in 2000 of ether.

Colour Tests Cyanogen bromide—orange-pink (after 1 to 2 min); Liebermann's reagent—orange.

Thin-layer Chromatography System TA—R_f 0.51; system TB—R_f 0.11; system TC—R_f 0.20; system TE—R_f 0.55; system TL—RF 06; system TAE—R_f 0.19; system TAF—R_f 0.30; system TAJ—R_f 0.95; system TAK—R_f 0.03; system TAL—R_f 0.69 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2253; system GB—RI 2340; system GC—RI 2954; system GF—RI 2600.

High Performance Liquid Chromatography System HA—*k* 3.2; system HX—RI 388; system HY—RI 270; system HAA—retention time 13.1 min.

Ultraviolet Spectrum Aqueous acid—290 nm ($A_1^1=347a$).

Infrared Spectrum Principal peaks at wavenumbers 775, 1580, 825, 990, 1509, 1146 cm⁻¹ (tripolidine hydrochloride, KBr disk).

Triphenyltetrazolium Chloride

Diagnostic Agent

C₁₉H₁₅ClN₄ = 334.8

CAS—298-96-4

IUPAC Name 2,3,5-Triphenyltetrazol-2-ium chloride

Synonyms Red tetrazolium; RT; TPTZ; 2,3,5-triphenyl-2H-tetrazolium chloride; TTC.

Proprietary Name *VitaStain*

Mass Spectrum Principal ions at m/z 208, 209, 278, 207, 193, 200, 194, 84.

Quantification

Plasma TLC-densitometry Limit of detection, 800 ng/L [DeAngelis *et al.* 1977].

Biological Samples HPLC-MS Limit of detection, 10 µg for triprolidine and its metabolite hydroxymethyltriprolidine [Hansen *et al.* 1989].

Disposition in the Body Irregularly absorbed after oral administration.

Therapeutic Concentration

Following oral administration of 15 mL of a syrup containing 3.75 mg of triprolidine hydrochloride to 16 subjects, peak plasma concentrations of 0.004 to 0.017 mg/L (mean, 0.009) were attained in about 2 h [DeAngelis *et al.* 1977].

Following oral administration of 2.5 mg of triprolidine hydrochloride and 60 mg of pseudoephedrine hydrochloride four times a day to 17 subjects for 5 days, peak plasma-triproclidine concentrations of 0.004 to 0.044 mg/L (mean, 0.013) were reported about 1.6 h after a dose [Perkins *et al.* 1980].

In 6 subjects receiving single oral doses of triprolidine hydrochloride (2.5 mg), peak plasma concentrations of 0.0027 to 0.0085 mg/L (mean, 0.0056) were achieved at 0.8 to 3.2 h (mean, 2.0). After wearing transdermal patches releasing triprolidine (base) 5 or 10 mg for 24 h, the same subjects had peak plasma concentrations of 0.001 to 0.003 mg/L (mean, 0.002) at 6.1 to 17.9 h (mean, 12.0) and 0.0022 to 0.0062 mg/L (mean, 0.0042) at 4.4 to 24.2 h (mean, 14.3), respectively [Miles *et al.* 1990].

Half-life Plasma half-life, 1.5 to 20 h (mean, 5).

Dose Usually 7.5 to 15 mg of triprolidine hydrochloride daily.

Troglitazone

Antidiabetic

$C_{24}H_{27}NO_5S$ = 441.5

CAS—97322-87-7

IUPAC Name 5-[[[4-[(6-Hydroxy-2,5,7,8-tetramethyl-3,4-dihydrochromen-2-yl)methoxy]phenyl]methyl]-1,3-thiazolidine-2,4-dione

Synonyms CL-991; CS-045; 5-[[[4-[(3,4-dihydro-6-hydroxy-2,5,7,8-tetramethyl-2H-1-benzopyran-2-yl)-methoxy]phenyl]methyl]-2,4-thiazolidine-2,4-dione; GR-92132X; romglizone.

Proprietary Names Noscac; Rezulin; Romozin.

Chemical Properties A white to yellowish crystalline compound with a characteristic odour. Mp 184° to 186°. Practically insoluble in water; soluble in *N,N*-dimethylformamide and acetone; sparingly soluble in ethyl acetate; slightly soluble in acetonitrile, anhydrous ethanol and ether.

Ultraviolet Spectrum Acetonitrile—225 nm.

Quantification

Blood HPLC Column: ODS (300 × 6.0 mm i.d., 5 µm). Mobile phase: acetonitrile:water:phosphoric acid (60:40:0.08), flow rate 1.2 mL/min. UV detection (λ =230 nm). Retention time: 23.2 min. Limit of quantification, 0.1 mg/L [Loi *et al.* 1997].

Plasma GC Limit of quantification, 40 nmol/L [Bjork, Pettersson 1990].

Other HPLC Tablets. UV detection (λ =225 nm). Limit of detection, 0.05 mg/L [Lambropoulos, Bergholdt 2000].

Disposition in the Body Troglitazone is rapidly absorbed and widely distributed into body tissues following oral administration. Absorption is increased in the presence of food, and peak plasma concentrations are reached generally 1–3 h after administration. It is extensively metabolised in the liver primarily by conjugation, and is excreted largely in the faeces as its metabolites. A few metabolites are also excreted in urine (3%). Steady state concentrations are achieved between 2 and 6 weeks. Three metabolites have been identified, a sulfate conjugate, a quinone conjugate and a glucuronide conjugate. The sulfate conjugate is the most abundant (7–10 times that of the parent drug). Eighty-five percent of the drug is recovered in faeces and 3.1% in urine. Pharmacokinetics are linear over clinical dosage range of 200–600 mg. No accumulation of the drug or its metabolites has been noted.

Therapeutic Concentration

Twelve healthy volunteers and 12 patients with type 2 diabetes were administered 400 mg troglitazone once a day for 15 days. Steady state plasma concentrations were reached by day 5 and peaked at 1.42 mg/L for the healthy individuals and 1.54 mg/L for those with diabetes. These concentrations were observed at 2.63 and 3.25 h, respectively [Loi *et al.* 1997].

Toxicity

A 44-year-old woman with a history of type 1 diabetes began treatment with 200 mg troglitazone daily for 4 weeks and then the dose was increased to 400 mg daily. On hospital admission she was icteric, her liver was tender and enlarged with subacute hepatic necrosis, fibrosis and cholestasis. Troglitazone treatment was stopped and after 3 months the patient gradually improved.

A 65-year-old woman with a history of type 2 diabetes was admitted with a 3-week history of nausea, anorexia, pruritus and jaundice. She was currently being treated with 400 mg daily troglitazone (had been for 6 weeks). Histologic tests showed chronic hepatitis (severe activity), hepatocyte necrosis and fibrosis. 3 months after treatment was discontinued, the patient showed improvement [Gitlin *et al.* 1998].

Bioavailability 53%.

Half-life 10–39 h.

Volume of Distribution Steady state 2.5 L/kg.

Clearance Systemic plasma clearance, 172 mL/min.

Distribution in Blood Distribution into red blood cells is low.

Protein Binding ≥99% at concentrations of 0.5–3 mg/L. Primarily to albumin.

Dose 200 mg.

Troglitazone

Antibiotic

$C_{41}H_{67}NO_{15}$ = 814.0

CAS—2751-09-9

IUPAC Name [6-[3-Acetyloxy-4-(dimethylamino)-6-methylloxan-2-yl]oxy-8-(5-acetyloxy-4-methoxy-6-methylloxan-2-yl)oxy-5,7,9,12,13,15-hexamethyl-10,16-dioxo-1,11-dioxaspiro[2.13]hexadecan-14-yl] acetate

Synonym Triacetylloleandomycin

Proprietary Names TAO; Triocetin.

Chemical Properties The triacetyl ester of oleandomycin. A white crystalline powder. Mp 176° with decomposition. Slightly soluble in water and ether; soluble 1 in 10 of ethanol and 1 in 1 of chloroform. pK_a 6.6. Log P (octanol/water), 2.5.

Colour Tests Mandelin's test—violet (slow); Marquis test—yellow-brown.

Thin-layer Chromatography System TA— R_f 0.65 (acidified iodoplatinate solution, positive).

Infrared Spectrum Principal peaks at wavenumbers 1744, 1239, 1735, 1053, 1004, 1123 cm^{-1} (KBr disk).

Dose The equivalent of 1 to 2 g of oleandomycin daily.

Trometamol

Treatment of Acidosis

$\text{C}_4\text{H}_{11}\text{NO}_3 = 121.1$

CAS—77-86-1

IUPAC Name 2-Amino-2-(hydroxymethyl)propane-1,3-diol

Synonyms THAM; trihydroxymethylaminomethane; TRIS; tris(hydroxymethyl)aminomethane; tromethamine.

Proprietary Names *Addex-THAM*; *Pleomix-Alpha*; *Tham*; *Thamacet*; *Thamesol*; *Thioctacid*; *Tris*; *TromLipon*.

Chemical Properties A white crystalline powder. Mp 171° to 172°. Soluble 1 in 1.8 of water, 1 in 45 of ethanol and 1 in 38 of methanol; practically insoluble in chloroform; slightly soluble in acetone and ether. pK_a 8.3 (20°). Log *P* (octanol/water), -1.6.

Thin-layer Chromatography System TA— R_f 0.57 (Ninhydrin spray, positive).

Gas Chromatography System GA—RI 1645.

Infrared Spectrum Principal peaks at wavenumbers 1031, 1018, 1076, 975, 1582, 1279 cm^{-1} (KBr disk).

Quantification

Plasma GC FID. Limit of detection, 5 $\mu\text{g/L}$ [Hulshoff, Kostenbauder 1978].

HPLC Fluorescence detection. For method, see Morris and Hieh [1993]. UV detection. Limit of detection, about 0.28 mg/L [Gumbhir, Mason 1992].

Serum TLC Limit of detection, 20 μg [Andermann, Andermann 1980].

Urine HPLC See Plasma [Morris and Hieh 1993].

Disposition in the Body About 75% of a dose is excreted in the urine as unchanged drug in 8 h and the remainder is excreted over 3 days. Trometamol may accumulate in the body if large doses are given frequently.

Therapeutic Concentration

Following an IV injection of 109 mg to an infant, a plasma concentration of 430 mg/L was reported at 0.5 h, declining to 86 mg/L at 4.5 h [Hulshoff, Kostenbauder 1978.]

Dose Up to 500 mg/kg by IV infusion.

Andermann G, Andermann C (1980). *J High Resolut Chromatogr Chromatogr Commun* 3: 36–37. Gumbhir K, Mason WD (1992). High-performance liquid chromatographic method for the determination of tris(hydroxymethyl)aminomethane (tromethamine) in human plasma. *J Chromatogr* 583: 99–104.

Tropacocaine

Anaesthetic (Local)

$\text{C}_{15}\text{H}_{19}\text{NO}_2 = 245.3$

CAS—537-26-8

IUPAC Name (8-Methyl-8-azabicyclo[3.2.1]octan-3-yl) benzoate

Synonyms Benzoylpseudotropeine; benzoylpseudotropine; benzoyl- Ψ -tropeine; benzoyltropeine; benzoyltropine; *o*-benzoyltropine; *exo*-8-methyl-8-azabicyclo[3.2.1]octan-3-yl benzoate (ester); pseudotropine benzoate; *1\alpha*H,*5\alpha*H-tropan-3 β -ol benzoate; Ψ -tropeine benzoate; troprocaine; troprocain.

Chemical Properties White crystalline powder. Mp 49°. Freely soluble in alcohol, ether, chloroform, benzene, petroleum ether, and dilute acids. Slightly

soluble in water [O'Neil *et al.* 2006]. Log *P* (octanol/water) 2.9 [National Institutes of Health 2008]; 2.7 [Meylan, Howard 1995]. pK_a 9.9 [Polasek *et al.* 1992].

Tropacocaine Hydrochloride

$\text{C}_{15}\text{H}_{19}\text{NO}_2 \cdot \text{HCl} = 280.8$

IUPAC Name 2-(8-Methyl-8-azabicyclo[3.2.1]octan-3-yl) benzoate chloride

Synonyms Benzoic acid tropane ester hydrochloride; *o*-benzoyl-pseudotropine hydrochloride; benzoyltropeine hydrochloride; NSC76018; pseudotropine benzoate hydrochloride; troprocaine hydrochloride; *1\alpha*-H,*5\alpha*-H-tropan-3 α -ol, benzoate (ester), hydrochloride.

Chemical Properties White crystalline powder. Mp 283°. Soluble in water, slightly soluble in absolute ethanol, practically insoluble in ether.

Thin-layer Chromatography System T1— R_f 0.35 (location reagent acidified iodoplatinate solution, positive reaction).

UV Spectrum Ethanol : water (1 : 1)—230, 273 μm .

Quantification

Plasma HPLC Nucleosil C₁₈ (250 × 4.6 mm i.d., 5 μm). Mobile phase: 0.05 mol/L citric acid : 0.1 mol/L dibasic sodium phosphate buffer (pH 3.0; 4 : 1) with 18% acetonitrile and 0.3% triethylamine, flow rate 1.5 mL/min. UV detection ($\lambda = 235$ nm). Limit of detection not reported [Virag *et al.* 1996].

Other GC Illicit Cocaine Samples. Column: 3% OV-1 Chromosorb WHP or 3% OV-17 Chromosorb WHP (both 1.52 m × 2 mm). Carrier gas: N₂, 30 mL/min. Temperature programme: 100° for 2 min to 320° at 12°/min for 5 min. Retention time, ≈11 min on OV-1 and ≈12.5 min on OV-17. Limit of detection not reported [Ensing *et al.* 1992].

GC-MS Greenhouse-cultivated Coca Leaves. Column: DB-1 fused silica capillary (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: H₂, 30–40 cm/s. Temperature programme: 150° for 1.0 min to 275° at 6.0°/min for 8.0 min. ⁶³Ni ECD or FID. Limit of detection not reported [Moore *et al.* 1994].

Note For a comparison of illicit cocaine samples using its ratio with 4 alkaloids, including troprocaine, see Janzen *et al.* [1992].

Disposition in the Body

Toxicity Anaesthesia is produced more quickly than with cocaine but is more transitory. LD₅₀ in rats (IV) is 20 mg/kg.

Dose Up to 300 mg daily.

Ensing JG *et al.* (1992). A rapid gas chromatographic method for the fingerprinting of illicit cocaine samples. *J Forensic Sci* 37: 446–459.

Janzen KE *et al.* (1992). Comparison analysis of illicit cocaine samples. *J Forensic Sci* 37: 436–445. Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol-water partition coefficients. *J Pharm Sci* 84: 83–92.

Tropicamide

Anticholinergic

$\text{C}_{17}\text{H}_{20}\text{N}_2\text{O}_2 = 284.4$

CAS—1508-75-4

IUPAC Name *N*-Ethyl-3-hydroxy-2-phenyl-*N*-(pyridin-4-ylmethyl)propanamide

Synonyms Bistropamide; *N*-ethyl- α -(hydroxymethyl)-*N*-(4-pyridinylmethyl) benzeneacetamide.

Proprietary Names *Diotrope*; *Mydral*; *Mydramide*; *Mydriacil*; *Mydriacyl*; *Mydrian*; *Mydriaticum*; *Mydrum*; *Myriacyl*; *Ocu-Tropic*; *Opticyl*; *Tropicacyl*; *Tropicil Top*; *Tropicol*; *Tropimil*; *Visumidriatic*.

Chemical Properties A white crystalline powder. Mp 96° to 97°. Soluble 1 in 160 of water, 1 in 3.5 of ethanol and 1 in 2 of chloroform. pK_a 5.2. Log *P* (octanol/water), 1.2.

Colour Tests Cyanogen bromide—violet-pink; Liebermann's reagent—yellow.

Thin-layer Chromatography System TA— R_f 0.65; system TE— R_f 0.51; system TF— R_f 0.03; system TAA— R_f 0.00 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—tropicamide RI 2335, tropicamide-CH₂O RI 2230, tropicamide-H₂O RI 2250, tropicamide-AC RI 2410; system GB—tropicamide RI 2442.

High Performance Liquid Chromatography System HX—RI 311.

Ultraviolet Spectrum Aqueous acid—254 nm ($A_1=180a$); aqueous alkali—256 nm.

Infrared Spectrum Principal peaks at wavenumbers 1627, 1601, 709, 1266, 761, 1070 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 92, 91, 65, 103, 93, 39, 163, 77.

Quantification

Aqueous Humour HPLC UV detection. For a method of quantification for tropicamide and phenylephrine, see Galmier *et al.* [2000].

Use As a 0.5 to 1% ophthalmic solution.

Galmier MJ *et al.* (2000). High-performance liquid chromatographic determination of phenylephrine and tropicamide in human aqueous humor. *Biomed Chromatogr* 14: 202–204.

Tropine

Anticholinergic

$\text{C}_8\text{H}_{15}\text{NO}$ = 141.2

CAS—120-29-6

IUPAC Name 8-Methyl-8-azabicyclo[3.2.1]octan-3-ol

Synonyms 2,3-Dihydro-3 α -hydroxytropidine; (3-endo)-8-methyl-8-azabicyclo[3.2.1]octan-3-ol; 5 α H-tropan-3 α -ol; tropan-3-ol.

Chemical Properties White powder that may be obtained by the hydrolysis of atropine. Mp 63°. Bp 233°. Soluble in water, ethanol, ether, and chloroform. pK_{a1} 10.4, pK_{a2} 9.85 [Kugel *et al.* 1994]. Log *P* (chloroform/buffer pH 9.0) 0.0124 [Eckert, Hinderling 1981]. Esters of tropine are known as tropeines

Thin-layer Chromatography System T1— R_f 0.40 (location reagent acidified iodoplatinate spray, positive reaction).

Plates: silica gel 60 F₂₅₄. Solvent system: A) ethyl acetate: isopropanol: concentrated ammonia (45:35:15); B) 70% ethanol: concentrated ammonia (95:5). UV detection (λ = 254 nm) or Dragendorff's reagent and 5% copper chloride solution. R_f : 0.27 in system A, 0.07 in system B. Limit of detection not reported [van der Meer *et al.* 1986].

Mass Spectrum Principal ions at m/z 82, 83, 42, 96, 141, 124, 55, 67, 113, Witte *et al.* [1987], Blossey *et al.* [1964].

Capillary Electrophoresis Capillary: fused silica (85 cm in length, 5 μm i.d.). Running buffer: 60 mmol/L ammonium acetate (pH 8.5) containing 5% isopropanol. ESI-TOF, positive ion mode. Migration time: 10.1 min. Limit of detection not reported [Arraez-Roman *et al.* 2008].

Quantification

Blood GC-MS Column: Ultra-1 cross-linked methyl silicone (25 $\text{m} \times 0.20$ mm i.d., 0.33 μm). Temperature programme: 100° to 240° at 20°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 10 $\mu\text{g/L}$ for atropine derivatised with PFPFA [Saady, Poklis 1989].

Plasma GC-MS Column: SE-54 (20 $\text{m} \times 0.31$ mm i.d.) or glass packed with 15% GE SF-96 (3 $\text{m} \times 2$ mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 90° to 140° at 10°/min for the capillary column, isothermic at 200°. EI ionisation at 70 eV. Retention time: 1.4 and 2.2 min for the capillary and glass column, respectively. Limit of detection, 2 $\mu\text{g/L}$ [Eckert, Hinderling 1981].

Urine HPLC Column: Radial Pak C₁₈ ODS silica (10 $\text{cm} \times 8$ mm i.d., 10 μm). Mobile phase: acetonitrile:20 mmol/L aqueous tetrabutyl ammonium hydrogen sulphate-50 mmol/L sodium acetate (pH 5; 25:75), flow rate 0.75 mL/min. UV detection (λ = 230 nm) or scintillation counting. Limit of detection not reported [van der Meer *et al.* 1986].

GC-MS Column: SE-54 (20 $\text{m} \times 0.31$ mm i.d.) or glass packed with 15% GE SF-96 (3 $\text{m} \times 2$ mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 90° to 140° at 10°/min for the capillary column, isothermic at 200°. EI ionisation at 70 eV. Retention time: 1.4 and 2.2 min for the capillary and glass column, respectively. Limit of detection, 20 $\mu\text{g/L}$ [Eckert, Hinderling 1981].

Other GC-MS Seeds from *Erythroxylum Coca* var. *Coca*. Column: DB-1 fused silica capillary (30 $\text{m} \times 0.25$ mm i.d., 0.25 μm). Temperature programme: 100° to 300° at 6°/min for 5.67 min. EI ionisation at 70 eV. Limit of detection not reported [Casale *et al.* 2005]. Rat Urine. Column: DB-1 capillary (30 $\text{m} \times 0.32$ mm i.d., 0.25 μm). Carrier gas: He, 2 mL/min. Temperature programme: 200° for 1 min to 280° at 10°/min for 10 min. EI ionisation at 70 eV, positive ion mode. Limit of detection not reported [He *et al.* 1995]. *Convolvulus arvensis*. Column: HP1 100% dimethylpolysiloxane (12 $\text{m} \times 0.2$ mm i.d.). Temperature programme: 80° for 2 min to 140° at 10°/min to 275° at 50°/min for 3 min. EI ionisation at 70 eV. Retention time: 7.6 min [Todd *et al.* 1995]. *Datura innoxia* Root Extracts. Column: fused silica methylsilicone DB1 (15 $\text{m} \times 0.25$ mm i.d.). FID and NPD. RI 1167. Limit of detection not reported [Witte *et al.* 1987].

LC-MS Rat Urine. Column: Zorbax C₁₈ (100 $\times 3.0$ mm i.d., 3.5 μm). Mobile phase: methanol:2 mmol/L ammonium acetate (pH 3.5; 70:30), flow rate, 0.2 mL/min. Positive ion mode. Retention time: 2.63 min. Limit of detection, <5 $\mu\text{g/L}$ [Chen *et al.* 2006]. Seeds from *Erythroxylum Coca* var. *Coca*. Column: Phenomenex C₁₈ (150 $\times 4.6$ mm i.d.). Mobile phase: 0.1% trifluoroacetic acid: acetonitrile (95:5 to 75:25 in 15 min for 5 min to 5:95 in 5 min to 95:5 in 1 min), flow rate 1.0 mL/min. APCI, positive ion mode. Limit of detection not reported [Casale *et al.* 2005].

Disposition in the Body Tropine is one of the metabolites of atropine.

TropisetronAntiemetic, 5-HT₃ Receptor AntagonistC₁₇H₂₀N₂O₂ = 284.4

CAS—89565-68-4

IUPAC Name [(1R,5S)-8-methyl-8-azabicyclo[3.2.1]octan-3-yl] 1H-indole-3-carboxylate**Synonyms** ICS-205-930; 1H-indole-3-carboxylic acid (3-endo)-8-methyl-azabicyclo[3.2.1]oct-3-yl ester.**Chemical Properties** Mp 201° to 202°.**Tropisetron Hydrochloride**C₁₇H₂₁ClN₂O₂ = 320.8

CAS—105826-92-4

Proprietary Names Navaban; Navoban.**Chemical Properties** Mp 283° to 285°.**Ultraviolet Spectrum** Principal peaks at 213, 231, 249, 283 nm.**Mass Spectrum** Principal ions at *m/z* 124, 82, 94, 83, 140, 144, 67, 284.**Quantification****Plasma HPLC** Column: Lichrosorb RP18 (250 × 7 mm i.d., 7 μm). Mobile phase: acetonitrile: water and 0.3% triethylamine (5: 95 to 15: 85 over 30 min, to 20: 80 over 10 min, to 90: 10 over 20 min). UV detection (λ=283 nm). Retention time: 60 min. Limit of quantification, 0.3 μg/L [Fischer *et al.* 1992].**Disposition in the Body** Tropisetron is rapidly and extensively absorbed from the gastrointestinal tract in ~20 min. Peak plasma concentrations are reached in about 3 h. Metabolism is saturable, which results in non-linear pharmacokinetics. It occurs by hydroxylation at the 5, 6 or 7 position of the indole ring, followed by a conjugation reaction to form the glucuronide or sulfate. These metabolites are excreted in urine or bile with a urine: bile ratio of 5: 1. Metabolism is linked to a genetically determined sparteine/debrisoquin polymorphism. Eight percent of the Caucasian population are thought to be poor metabolisers, but there is no change in metabolism in cases of renal impairment or in the elderly. Tropisetron is not accumulative.**Therapeutic Concentration** In serum, the trough therapeutic concentration is 20 to 30 mg/L and the peak serum concentrations are 50 to 100 mg/L.Following an oral dose of 20 or 100 mg, the mean and peak plasma concentrations are 24.7 and 173 μg/L, respectively, which occurred after 1.3 and 1.1 h, respectively [Lee *et al.* 1993].Twelve healthy males were administered 20 or 100 mg single, oral doses and the maximum concentrations observed were 0.087 and 0.608 μg/L, respectively [Fischer *et al.* 1992].**Toxicity** At very high doses of 100 mg for 5 days, visual hallucinations may occur.**Bioavailability** ≥95%. Absolute bioavailability depends on the dose.**Half-life** 7.3 h (IV), 8.6 h (oral) in extensive metabolisers; 30.3 h (IV) and 41.9 h (oral) in poor metabolisers.**Volume of Distribution** 400–600 L.**Clearance** In extensive metabolisers, the total clearance is 1 L/min, renal clearance is 10%. In poor metabolisers, total clearance is 0.1–0.2 L/min and the renal clearance is unchanged.**Protein Binding** 59–71%, mainly to α₁ glycoprotein.**Dose** 2 to 5 mg IV; 5 mg orally.Fischer V *et al.* (1992). Pharmacokinetics and metabolism of the 5-hydroxytryptamine antagonist tropisetron after single oral doses in humans. *Drug Metab Dispos* 20(4): 603–607.Lee C *et al.* (1993). Tropisetron. A review of its pharmacodynamic and pharmacokinetic properties, and therapeutic potential as an antiemetic. *Drugs* 46: 925–943.**Tryptamine**

Putrefactive Base

C₁₀H₁₂N₂ = 160.2

CAS—61-54-1

IUPAC Name 2-(1H-Indol-3-yl)ethanamine**Chemical Properties** A white crystalline powder. Mp 118°. Practically insoluble in water, chloroform, benzene and ether; soluble in ethanol and acetone. Log P (octanol/water), 1.6.**Tryptamine Hydrochloride**C₁₀H₁₂N₂·HCl = 196.7

CAS—343-94-2

Chemical Properties A white crystalline powder. Mp 248°. Soluble in water.**Colour Tests** *p*-Dimethylaminobenzaldehyde—red/violet; formaldehyde-sulfuric acid—brown; Marquis test—orange.**Thin-layer Chromatography** System TA—R_f 0.23; system TB—R_f 0.01; system TC—R_f 0.02; system TE—R_f 0.26; system TL—R_f 0.11; system TAE—R_f 0.06; system TAJ—R_f 0.00; system TAK—R_f 0.05; system TAL—R_f 0.36 (acidified iodoplatinate solution, positive).**Gas Chromatography** System GA—Tryptamine RI 1725, tryptamine-AC RI 2390, tryptamine-AC₂ RI 2440.**High Performance Liquid Chromatography** System HA—*k* 1.2; system HY—RI 190.**Ultraviolet Spectrum** Aqueous acid—278 (A₁¹=353a), 287 nm.**Infrared Spectrum** Principal peaks at wavenumbers 742, 1585, 1233, 1035, 909, 1494 cm⁻¹ (KBr disk).**Mass Spectrum** Principal ions at *m/z* 130, 131, 30, 160, 77, 103, 132, 102.

Quantification See under Tryptophan.

Tryptophan

Amino Acid

$C_{11}H_{12}N_2O_2 = 204.2$

CAS—73-22-3

IUPAC Name (2S)-2-Amino-3-(1H-indol-3-yl)propanoic acid

Synonyms (S)- α -Amino-1H-indole-3-propanoic acid; L-Trp; L-tryptophan; tryptophanum.

Proprietary Names *Ardeytropin*; *Kalma*; *Optimax*; *Pacitron*; *Trofan*; *Tryptan*.

Chemical Properties White to slightly yellowish-white crystals or crystalline powder. Soluble 1 in ≈ 100 of water; very slightly soluble in ethanol; soluble in hot ethanol; insoluble in chloroform; practically insoluble in ether; soluble in solutions of dilute mineral acids and alkali hydroxides. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

Gas Chromatography System GA—tryptophan-Me-AC RI 2150, tryptophan-Me₂-AC RI 2170; M (OH-skatole) RI 1370, M (indole acetic acid)-Me RI 1900, M (indole formic acid)-Me RI 1940; M (tryptamine) RI 1725.

Ultraviolet Spectrum Aqueous acid—278 ($A_1^1=290b$), 286 nm ($A_1^1=234b$); aqueous alkali—280, 288 nm.

Quantification

Blood LC-MS For a method of quantification for tryptophan and other amino acids in dried blood, see Casetta *et al.* [2000].

Plasma LC-MS See Blood [Casetta *et al.* 2000].

Serum HPLC Limit of quantification, 5 $\mu\text{mol/L}$ for tryptophan and other amino acids [Tcherkas *et al.* 2001]. UV detection. Limit of detection, $\approx 0.6 \mu\text{mol/L}$ [Tang *et al.* 1998].

Urine HPLC Fluorescence detection. For a method of quantification for tryptamine, see Tsuchiya *et al.* [1989].

Note For a review of the quantification of tryptophan and its metabolites, see Molnar-Perl [1999].

Dose 3 to 6 g daily.

Tuaminoheptane

Sympathomimetic

$C_7H_{17}N = 115.2$

CAS—123-82-0

IUPAC Name Heptan-2-amine

Chemical Properties A colourless or pale yellow volatile liquid. Bp 142° to 144°. It absorbs carbon dioxide on exposure to air, forming a white precipitate of tuaminoheptane carbonate. Sp. gr. 0.760 to 0.763. Slightly soluble in water; freely soluble in ethanol, ether, chloroform and benzene. pK_a 10.6. Log *P* (octanol/water), 2.4.

Tuaminoheptane Sulfate

$(C_7H_{17}N)_2 \cdot H_2SO_4 = 328.5$

CAS—6411-75-2

Proprietary Names *Tuamine Sulfate*. It is an ingredient of *R(h)inofluimucil*.

Chemical Properties A white powder. Freely soluble in water; soluble in ethanol; sparingly soluble in ether.

Thin-layer Chromatography System TA— R_f 0.33; system TB— R_f 0.01; system TC— R_f 0.07; system TL— R_f 0.24 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 888; system GC—RI 1287.

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Mass Spectrum Principal ions at m/z 44, 30, 42, 41, 29, 27, 100, 55.

Use As a 1% solution of the sulfate for nasal drops or spray.

Tubocurarine Chloride

Muscle Relaxant

$C_{37}H_{42}Cl_2N_2O_6 \cdot 5H_2O = 771.7$

CAS—57-95-4 (tubocurarine); 57-94-3 (chloride, anhydrous); 6989-98-6 (chloride, pentahydrate)

Synonyms 7',12'-Dihydroxy-6,6'-dimethoxy-2,2',2'-trimethyltubocuraranium dichloride pentahydrate; dextrotubocurarine chloride; D-tubocurarine chloride.

Proprietary Names *Curarina Miro*; *Curarine*; *Jexin*; *Tubarine*.

Chemical Properties The chloride of an alkaloid, (+)-tubocurarine. It may be obtained from extracts of the stems of *Chondodendron tomentosum* (Menispermaceae). A white or slightly yellowish-white or greyish-white crystalline powder. Mp about 270°, with decomposition. Soluble 1 in 20 of water; soluble in ethanol and methanol; insoluble in chloroform, benzene, acetone and ether. pK_a 8.0, 9.2 (22°).

Colour Tests Aromaticity (method 2)—yellow/brown; Folin-Ciocalteu reagent—blue; Liebermann's reagent—black; Mandelin's test—brown; Millon's reagent (hot)—red; nitric acid, cold—gives a black colour.

Thin-layer Chromatography System TA— R_f 0.00; system TB— R_f 0.00; system TC— R_f 0.00; system TE— R_f 0.00; system TL— R_f 0.00; system TN— R_f 0.85; system TO— R_f 0.40; system TAE— R_f 0.00; system TAF— R_f 0.11 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2495.

High Performance Liquid Chromatography System HX—RI 321; system HY—RI 257.

Ultraviolet Spectrum Water—280 nm ($A_1^1=119a$).

Infrared Spectrum Principal peaks at wavenumbers 1516, 1228, 1120, 1280, 1265, 1165 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 298, 594, 58, 593, 299, 609, 595, 564.

Quantification

Plasma HPLC UV detection. Limit of detection, 25 $\mu\text{g/L}$ [Meulemans *et al.* 1981].

Serum Radioimmunoassay Limit of detection, 5 $\mu\text{g/L}$ [Horowitz, Spector 1973].

Urine Radioimmunoassay See Serum [Horowitz, Spector 1973].

Postmortem Tissues UV spectrophotometry For method, see Stevens and Fox [1971].

Disposition in the Body After IV administration it is widely distributed throughout the tissues and is concentrated at the neuromuscular junctions; slowly and irregularly absorbed following IM injection. About 45% of a dose is excreted in the urine unchanged in 24 h.

Therapeutic Concentration In plasma, usually in the range 0.7 to 1 mg/L.

After an IV bolus of 540 $\mu\text{g/kg}$ followed by constant IV infusion of 2.9 $\mu\text{g/kg/min}$ to 9 subjects, a mean steady-state plasma concentration of 1.1 mg/L was attained in about 1 h [Ramzan *et al.* 1980].

Toxicity

In a fatality caused by tubocurarine, a postmortem liver concentration of about 0.8 $\mu\text{g/g}$ was reported [Stevens, Fox 1971].

Half-life Plasma half-life, about 2 to 4 h.

Volume of Distribution About 0.3 to 0.6 L/kg.

Clearance Plasma clearance, about 2 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, 1.9.

Protein Binding 33 to 50%.

Note For a review of the pharmacokinetics of neuromuscular blocking agents, see Ramzan *et al.* [1981].

Dose Initially 10 to 15 mg IV, with additional doses of 5 mg.

Horowitz PE, Spector S (1973). Determination of serum d-tubocurarine concentration by radioimmunoassay. *J Pharmacol Exp Ther* 185: 94-100.

Tybamate

Tranquilliser

$\text{C}_{13}\text{H}_{26}\text{N}_2\text{O}_4 = 274.4$

CAS—4268-36-4

IUPAC Name [2-(Carbamoyloxymethyl)-2-methylpentyl] N-butylcarbamate

Synonym Butylcarbamic acid 2-[[aminocarbonyloxy]methyl]-2-methylpentyl ester.

Proprietary Names Nospain; Solacen; Tybatran.

Chemical Properties White crystalline powder or clear viscous liquid which may congeal to a solid form on standing. Mp of the powder 49° to 51°. Very slightly soluble in water; very soluble in ethanol and acetone; freely soluble in ether. Log *P* (octanol/water), 2.9.

Thin-layer Chromatography System TA— R_f 0.77; system TD— R_f 0.35; system TE— R_f 0.65; system TF— R_f 0.68 (furfuraldehyde reagent, positive).

Gas Chromatography System GA—RI 1725; system GF—RI 2130.

Ultraviolet Spectrometry No significant absorption, 230–360 nm.

Infrared Spectrometry Principal peaks at wavenumbers 1695, 1250, 1065, 1538, 1600, 1140 cm^{-1} (KBr disk) [Douglas *et al.* 1966].

Mass Spectrum Principal ions at m/z 55, 72, 97, 41, 56, 158, 118, 57.

Quantification

Plasma GC Column: 3.8% UC-W98 methyl silicone 80/100 mesh Diatport S (121.9 cm). Carrier gas: He, 65 mL/min. Temperature: 180°. FID. Retention time: 5.0 min. Limit of detection, 1 mg/L [Douglas *et al.* 1969].

Urine See Plasma [Douglas *et al.* 1969].

Disposition in the Body Readily absorbed after oral administration. Metabolised in the liver and excreted in the urine, mainly as hydroxylated compounds. Meprobamate can appear as a minor metabolite [Douglas *et al.* 1966].

Half-life Plasma half-life, about 3 h.

Dose Usually 0.75 to 2 g daily; maximum of 3 g daily.

Douglas JF *et al.* (1966). The metabolic fate of tybamate in the rat and dog. *Biochem Pharmacol* 15: 2087-2095.

Tylosin

Antibiotic (Veterinary)

$\text{C}_{46}\text{H}_{77}\text{NO}_{17} = 916.1$

CAS—1401-69-0

IUPAC Name 2-[(4R,5S,6S,7R,9R,11E,13E,15R,16R)-6-[(2S,4S,5R,6S)-5-[(2R,4S,5R,6R)-4,5-Dihydroxy-4,6-dimethyloxan-2-yl]oxy-4-(dimethylamino)-3-hydroxy-6-methyloxan-2-yl]oxy-16-ethyl-4-hydroxy-15-[[[(1R,2S,3R,4R,5S)-4-hydroxy-2,3-dimethoxy-5-methylcyclohexyl]oxymethyl]-5,9,13-trimethyl-2,10-dioxo-1-oxacyclohexadeca-11,13-dien-7-yl]acetaldehyde

Proprietary Names Bilosin; Norotyl; Tylacre; Tylamix; Tylan; Tyluvet (includes proprietary names of Tylosin salts). Tylosin Tartrate is an ingredient of *Tylan Soluble*, *Tylo* and *Tyloximix*. Tylosin phosphate is an ingredient of *Tylan G* and *Tylasul-G*.

Chemical Properties An antimicrobial substance with a macrolide structure, produced by a strain of *Streptomyces fradiae*. An almost white to buff-coloured powder. Mp 128° to 132°. Slightly soluble in water; soluble in lower alcohols, esters, ketones, chlorinated hydrocarbons, benzene and ether. pK_a 7.73 (25°). Log *P* (octanol/water), 1.6.

Tylosin Tartrate

CAS—1405-54-5

Chemical Properties A white to buff-coloured hygroscopic powder. Mp 140° to 146°. Soluble 1 in 10 of water; slightly soluble in ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Colour Tests Mandelin's test—yellow→yellow—brown; Marquis test—yellow-brown; sulfuric acid—yellow-brown (slow).

Thin-layer Chromatography System TA— R_f 0.72 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—290 nm ($A_1^1=225b$).

Infrared Spectrum Principal peaks at wavenumbers 1075, 1052, 1162, 1111, 1010, 1587 cm^{-1} .

Tymazoline

Nasal Decongestant, Sympathomimetic

$C_{14}H_{20}N_2O = 232.3$

CAS—24243-97-8

IUPAC Name 2-[(5-Methyl-2-propan-2-ylphenoxy)methyl]-4,5-dihydro-1H-imidazole

Synonyms 4,5-Dihydro-2-[[5-methyl-2-(1-methylethyl)phenoxy]methyl]-1H-imidazole; 2-[(*p*-mentha-1,3,5-trien-2-yloxy)methyl]-2-imidazoline; 2-(thymyloxymethyl)glyoxalidine; 2-(thymyloxy)methyl-2-imidazoline.

Tymazoline Hydrochloride

$C_{14}H_{20}N_2O \cdot HCl = 268.8$

CAS—28120-03-8

IUPAC Name 2-[(5-Methyl-2-propan-2-ylphenoxy)methyl]-4,5-dihydro-1H-imidazole hydrochloride

Proprietary Names *Pernazene*; *Thymazen*.

Chemical Properties Crystals. Mp 215° to 217°, also reported as 223.5° to 225° [O'Neil *et al.* 2006].

O'Neil MJ *et al.* (2006). *The Merck Index: An Encyclopedia of Chemicals, Drugs and Biologicals*, 14th edn. Whitehouse Station, NJ: Merck & Co., Inc.

Tyramine

Diagnostic Agent, Sympathomimetic

$C_8H_{11}NO = 137.2$

CAS—51-67-2

IUPAC Name 4-(2-Aminoethyl)phenol

Synonyms *p*-Tyramine; tyrosamine.

Chemical Properties Colourless crystals. Mp 164° to 165°. Soluble 1 in 95 of water and 1 in 10 of boiling ethanol; sparingly soluble in benzene and xylene. pK_a 9.5 (phenol), 10.8 ($-NH_2$). Log *P* (octanol/water), 0.9.

Tyramine Hydrochloride

$C_8H_{11}NO \cdot HCl = 173.6$

CAS—60-19-5

Proprietary Name *Mydrial*

Chemical Properties Crystals. Mp 269°. Soluble in water.

Colour Tests *p*-Dimethylaminobenzaldehyde—orange/violet; Marquis test—brown→green.

Thin-layer Chromatography System TA— R_f 0.31 (acidified potassium permanganate solution, positive).

Gas Chromatography System GA—tyramine RI 1745; tyramine-AC₂ RI 1950.

High Performance Liquid Chromatography System HA—*k* 1.2; system HB—*k* 0.81; system HC—*k* 1.47; system HY—RI 77.

Ultraviolet Spectrum Aqueous acid—274 nm ($A_1^1=110a$); aqueous alkali—294 nm ($A_1^1=182b$).

Infrared Spectrum Principal peaks at wavenumbers 1266, 1518, 1595, 822, 1495, 1612 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 30, 108, 107, 77, 39, 51, 137, 27.

Quantification

Urine GC ECD. Limit of detection, 25 ng [Coutts *et al.* 1980].

Dose Tyramine hydrochloride has been given orally in doses of up to 250 mg daily in the investigation of migraine.

Coutts RT *et al.* (1980). A rapid, sensitive method of measuring meta- and para-tyramine levels in urine using electron-capture gas chromatography. *Res Commun Chem Pathol Pharmacol* 28: 177–184.

U

Urea*Diuretic*CH₄N₂O = 60.1

CAS—57-13-6

IUPAC Name Urea**Synonyms** Carbamide; carbonyldiamide; ureia; ureum.**Proprietary Names** *Aquacare; Aquadrate; Balisa; Basodexan; Calmurid; Calmuril; Carmol; Dermaflex; Elacutan; Fenuril; Gormel; Karbasal; Lanaphilic; Monilen; Nubral; Nutraplus; Ti-U-Lac; Ultra-Mide; Ureacin; Ureaphil; Urecrea; Urecrem; Urederm; Uree; Uremol; Urisec.***Chemical Properties** Colourless, slightly hygroscopic, prismatic crystals or pellets, or white crystalline powder. Mp 133°; decomposes on further heating. Soluble 1 in about 1 of water, 1 in 6 of methanol, 1 in 10 of ethanol, 1 in 1 of boiling ethanol and 1 in 2 of glycerol; practically insoluble in chloroform and ether. pK_a 0.1 (21°). Log *P* (octanol/water), -2.1.**Colour Test** Nessler's reagent—brown-orange.**Thin-layer Chromatography** System TA—R_f 0.55; system TE—R_f 0.15; system TAJ—R_f 0.05; system TAK—R_f 0.15; system TAL—R_f 0.30.**Gas Chromatography** System GA—not eluted.**Mass Spectrum** Principal ions at *m/z* 60, 44, 28.**Disposition in the Body** Rapidly absorbed after oral administration. Excreted in the urine as unchanged drug and also metabolised to ammonium salts in the colon. Endogenous urinary excretion is in the range 10 to 35 g in 24 h; urea is not usually found in the faeces.**Therapeutic Concentration** Endogenous concentrations in blood are about 300 mg/L in adults and lower in infants.After IV infusion of 0.6 to 1.2 g/kg of a solution containing 30% urea and 10% invert sugar to 7 subjects over a period of 0.5 to 2 h, plasma concentrations at the end of the infusion were reported to range from 1160 to 3400 mg/L (mean, 2430) [Yarnell *et al.* 1972].**Half-life** Biological half-life, about 1 h.**Dose** 40 to 80 g by IV infusion, not exceeding 1.5 g/kg daily.Yarnell PR *et al.* (1972). Plasma urea kinetics in urea infusion. *Clin Pharmacol Ther* 13: 558–562.**Urethane***Antineoplastic*C₃H₇NO₂ = 89.1

CAS—51-79-6

IUPAC Name Ethyl carbamate**Synonyms** Carbamic acid ethyl ester; ethyl carbamate; ethylurethane; urethan.**Chemical Properties** Colourless crystals or white granular powder. Mp 48° to 50°. Bp 182° to 184°. Soluble 1 in 0.5 of water, 1 in 0.8 of ethanol, 1 in 0.9 of chloroform, 1 in 1.5 of ether, 1 in 2.5 of glycerol and 1 in 32 of olive oil. Log *P* (octanol/water), -0.2.**Gas Chromatography** System GA—RI 838.**Infrared Spectrum** Principal peaks at wavenumbers 1713, 1075, 1610, 805, 1010 cm⁻¹ (KBr disk).**Dose** Formerly given in doses of 3 g daily; maximum of 6 g daily.

Valaciclovir

Antiviral

$C_{13}H_{20}N_6O_4 = 324.3$
CAS—124832-26-4

IUPAC Name 2-[(2-Amino-6-oxo-3H-purin-9-yl)methoxy]ethyl (2S)-2-amino-3-methylbutanoate

Synonyms 256U87; valacyclovir; L-valine 2-[(2-amino-1,6-dihydro-6-oxo-9H-purin-9-yl)methoxy]ethyl ester.

Chemical Properties pK_a 1.90, 7.47, 9.43.

Valaciclovir Hydrochloride

$C_{13}H_{21}ClN_6O_4 = 360.8$
CAS—124832-27-5

Proprietary Names Valtrex; Zelitrex.

Chemical Properties A white to off-white crystalline powder. Soluble in water (174 g/L at 25°).

Ultraviolet Spectrum Aqueous solution—252.8 nm.

Quantification

Plasma HPLC Limit of detection, 0.625 mg/L [Poirier *et al.* 1999].

Serum HPLC Column: RP-8 SymmetryShield (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile:0.025 mol/L monoammonium phosphate buffer (pH 4.0), flow rate 1.0 mL/min. UV detection (λ=254 nm). Retention time: 9.7 min. Limit of detection, 0.07 mg/L, lower limit of quantification, 0.25 mg/L [Pham-Huy *et al.* 1999].

Tissue HPLC Limit of quantification, 0.001 mg/L [Sinko *et al.* 1998].

Disposition in the Body Valaciclovir is absorbed easily and rapidly from the gastrointestinal tract after oral administration. Absorption is unaffected by administration with food. Valaciclovir is rapidly converted to aciclovir (99% of a dose) and valine by first-pass intestinal and/or hepatic metabolism, mediated by valaciclovir hydrolase. Plasma concentrations of valaciclovir are undetectable after 3 h and plasma aciclovir concentrations can be detected as early as 15 min. Elimination is renal as aciclovir, and the metabolites 9-carboxymethoxymethylguanine (CMMG) and 8-hydroxy-aciclovir (8-OHACV). <1% of the administered dose of valaciclovir is recovered unchanged in urine over a 24 h period. Peak plasma valaciclovir concentrations are generally less than 0.5 mg/L at all doses. Hepatic impairment does not affect pharmacokinetics. No accumulation of aciclovir occurs after administration of valaciclovir at the recommended dosage regimens in healthy individuals.

Therapeutic Concentration

Thirty-nine elderly normotensive or hypertensive volunteers with a mean age of 72 years were administered the following dose regimen: 500 or 1000 mg valaciclovir twice on day 1; 500 or 1000 mg three times a day for days 2 to 7; and either doses once on day 8 (a total of 21 doses). Peak aciclovir concentrations for the normotensive patients receiving 500 mg valaciclovir were 4.14 mg/L on day 1 and 4.30 mg/L on day 8 (steady state) observed at 1.41 and 1.22 h, respectively. For the 1000 mg dose, however, peak concentrations were 5.66 mg/L at 1.67 h on day 1 and 5.98 mg/L at 2.06 h at steady state. For the hypertensive patients, also receiving thiazide diuretics, peak concentrations with the 500 mg dose were 3.56 mg/L on day 1 observed after 1.22 h and 3.89 mg/L in the steady state at 1.47 h [Wang *et al.* 1996].

Twenty pregnant women (at 36 weeks' gestation) with a history of reoccurring genital herpes simplex virus infections (with positive herpes simplex virus 2 serological results) were administered 500 mg valaciclovir

twice daily for 2 weeks. Peak aciclovir plasma concentrations were 3.14 mg/L after the initial dose and 3.03 mg/L at steady state (after 2 weeks dosing) [Kimberlin *et al.* 1998].

Bioavailability Approximately 54%.

Half-life Three hours as aciclovir which may be increased to 14 h in patients with end stage renal disease.

Volume of Distribution Has not been calculated, as the drug has not been administered IV and the elimination rate constant has not been accurately measured. Aciclovir is 50 L in a typical adult.

Clearance Aciclovir, 679 mL/min/1.73 m² in healthy individuals and 86 mL/min/1.73 m² in dialysis patients. The mean renal clearance is 15.3 L/h after a single 1000 mg dose of valaciclovir.

Protein Binding 13.5 to 17.9%.

Dose 1 g oral dose.

Valdecoxib

Analgesic, Antiinflammatory, COX-2 Inhibitor, Sulfonamide

$C_{16}H_{14}N_2O_3S = 314.4$
CAS—181695-72-7

IUPAC Name 4-(5-Methyl-3-phenyl-1,2-oxazol-4-yl)benzenesulfonamide

Synonyms 4-(5-Methyl-3-phenyl-4-isoxazolyl)benzenesulfonamide; SC-65872.

Proprietary Names Bextra; Valus Insta; Valus-XT; Vectra-P; Vorth Insta; Vorth-XT.

Chemical Properties A white crystalline powder. Mp 155° to 157°. Freely soluble in organic solvents and alkaline aqueous solutions; soluble in methanol and ethanol; insoluble in water (10 mg/L at 25°). Stability in plasma was established for 21 days at –20°, in frozen plasma at –20° for at least 3 freeze-thaw cycles, over a period of 24 h at 5°, and on the benchtop for 8 h [Pavan Kumar *et al.* 2006]. Stability of valdecoxib in plasma stored at –80°C including 2 freeze-thaw cycles was >90%. Standard solutions were found to be stable at –80° for at least 2 months and a minimum of 2 weeks when stored protected from light at room temperature [Werner *et al.* 2005]. Stability in plasma was excellent with no evidence of degradation with 30 days freezer storage. [Ramakrishna *et al.* 2004]. Samples were stable in urine for 133 days at –20°. [Zhang *et al.* 2003a].

High Performance Liquid Chromatography Column: Reversed-phase Intersil C₁₈. Mobile phase: methanol:0.05% aqueous glacial acetic acid (68:32). DAD (λ = 230 nm). Limit of detection, 0.127 to 1.04 mg/L [Rao *et al.* 2005].

Mass Spectrum Principal ions at *m/z* 118, 313, 80, 192, 233, 144, 172, 206.

Quantification

Plasma HPLC Column: Kromasil KR 100-5 C₁₈ (250 × 4.6 mm i.d., 5 μm) Mobile phase: 0.05 mol/L formic acid (pH 3.0) : water-acetonitrile (5 : 95) : methanol-water (90 : 10; 100 : 0 : 0 at 0 min to 90 : 0 : 10 at 2 min to 50 : 20 : 30 at 9 min to 30 : 50 : 20 at 25 min to 10 : 85 : 5 at 35 min to 100 : 0 : 0 at 36 min until 45 min), flow rate 1.0 mL/min. UV detection (λ = 235 nm). Limit of quantification, 0.1 mg/L [Pavan Kumar *et al.* 2006]. Column: C₁₈. Mobile phase: acetonitrile : water (pH 3.2; 60 : 40), flow rate 1 mL/min. UV detection (λ = 240 nm). Limit of detection, 10 μg/L [Keshetty *et al.* 2006]. Column: Reversed phase ODS-AQ. Mobile phase: methanol : water (53 : 47). UV detection (λ = 210 nm). Limit of quantification, 10 μg/L [Ramakrishna *et al.* 2004].

LC-MS Limit of quantification, valdecoxib 0.5 μg/L, valdecoxib hydroxy metabolite 0.5 μg/L [Zhang *et al.* 2003b]. Column: Nucleosil C₈ guard column (120-5, 8 × 3 mm). Mobile phase: methanol : water (50 : 50), flow rate 300 μL/min. APCI, SRM acquisition mode. Limit of quantification, 5 μg/L [Werner *et al.* 2005].

Urine LC-MS Column: Reversed phase. Mobile phase: acetonitrile : water (50 : 50) containing 10 mmol/L 4-methylmorpholine (pH 6.0). Limit of quantification, valdecoxib 1 μg/L, valdecoxib hydroxy metabolite 1 μg/L, valdecoxib carboxylic acid metabolite 2 μg/L [Zhang *et al.* 2003a].

Disposition in the Body Extensively metabolised in the liver after absorption primarily via CYP2C9 and CYP3A4 to valdecoxib *N*-glucuronide, a hydroxylated metabolite, and a carboxylic acid metabolite. Approximately 70% is excreted in urine as the glucuronide conjugates of valdecoxib and its hydroxylated metabolite [Zhang *et al.* 2003a], and 20% in faeces as the metabolites, with less than 5% of the parent drug excreted unchanged.

Therapeutic Concentration

Eight healthy men (aged 20 to 42 years) were administered 10 mg daily for 14 days. Peak plasma concentrations reached 161 μg/L after 2.25 h and the minimum concentration was 21.9 μg/L. Steady state concentrations were reached by day 4 [Pfizer 2004].

Toxicity On April 7 2005 valdecoxib was withdrawn from the US market because of an increased risk of cardiovascular events as well as the risk of serious, sometimes fatal, skin reactions, including toxic epidermal necrolysis, Stevens–Johnson syndrome, and erythema multiforme. To date (2008) the FDA has received 7 reported deaths from serious skin reactions following valdecoxib therapy.

Bioavailability Absolute, 83%.

Half-life Elimination, 8 to 11 h which increases with age.

Clearance Oral, 6 L/h.

Distribution in Blood Blood : plasma ratio, 2.5 : 1.

Protein Binding Approximately 98%.

Dose 10 mg daily.

Valethamate Bromide

Anticholinergic

C₁₉H₃₂BrNO₂ = 386.4

CAS—16376-74-2 (valethamate); 90-22-2 (bromide)

IUPAC Name *N,N*-Diethyl-*N*-methyl-2-[(3-methyl-1-oxo-2-phenylpentyl)oxy]-ethanaminium bromide

Proprietary Name *Epidosin*

Chemical Properties A white crystalline powder. Mp 100° to 101°. Freely soluble in water; very soluble in ethanol; practically insoluble in ether. Log *P* (octanol/water), 1.1.

Thin-layer Chromatography System TA—R_f 0.02 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—253, 259 (A₁¹ = 5.4b), 265 nm.

Infrared Spectrum Principal peaks at wavenumbers 1730, 1230, 695, 726, 1163, 1265 cm⁻¹ (KBr disk).

Dose 30 to 80 mg daily.

Valproic Acid

Anticonvulsant, Antiepileptic

C₈H₁₆O₂ = 144.2

CAS—99-66-1

IUPAC Name 2-Propylpentanoic acid

Proprietary Names *Convulex (capsules); Cryoval; Depakene (capsules); Deproic; Ergenyl; Mylproin; Proteval; Provetal; Valcaps; Valken; Valporal; Valprosid.*

Chemical Properties A colourless liquid. Very slightly soluble in water. p*K*_a 4.6. Log *P* (octanol/water), 2.8. Extraction yield (chlorobutane), 0.07 [Demme *et al.* 2005].

Sodium Valproate

C₈H₁₅NaO₂ = 166.2

CAS—1069-66-5

Proprietary Names *Absenor; Convulex (solution and tablets); Delepsine; Depacon; Depakene (syrup); Depakin(e); Deplexil; Deproic; Encorate; Epilim; Ergenyl; Leptilan; Leptilanil; Orfiril; Orlept; Selenica; Valpakine; Valparin; Valporal; Valpro; Valprosid.*

Chemical Properties A white, crystalline, deliquescent powder. Soluble 1 in 4 of water, 1 in 5 of ethanol; practically insoluble in common organic solvents.

Colour Test Ferric chloride—orange.

Thin-layer Chromatography System TD—R_f 0.00; system TE—R_f 0.00; system TF—R_f 0.52; system TAD—R_f 0.00.

Gas Chromatography System GA—RI 1064; system GB—RI 1098; system GE—RRT 0.09 (relative to phenytoin); system GAJ—RRT 0.350 (relative to methylphenobarbital).

High Performance Liquid Chromatography System HZ—RT 8.0 min.

Infrared Spectrum Principal peaks at wavenumbers 1708, 1213, 1250, 1278, 946, 1107 cm⁻¹ (thin film).

Mass Spectrum Principal ions at *m/z* 73, 102, 41, 57, 43, 27, 55, 29.

**Quantification**

Plasma GC Column: Stabilwax (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: H₂, 45 cm/s. Temperature programme: 40° for 0.5 min to 120° at 50°/min to 150° at 2°/min to 250° at 50°/min for 5 min. ECD. Limit of quantification, 0.1 mg/L [Dills, Shen 1997]. Column: Nukol (30 m × 0.2 mm i.d., 0.25 μm). Temperature programme: 60° for 2 min to 150° at 30°/min to 190° at 10°/min for 4 min. FID. Limit of detection, 1 μg/L [Krogh *et al.* 1995]. Column: Chrom Q 100 mesh (1.2 m × 4 mm i.d.). Carrier gas: N₂, 0.55 kg/cm². Temperature: 160°. FID. Limit of detection, 2 mg/L [Pokrajac *et al.* 1992]. Column: DB-1 (60 m × 0.25 mm i.d., 0.25 μm).

Carrier gas: H₂, 40 cm/s. Temperature programme: 40° for 0.5 min to 80° at 40°/min for 2 min to 250° at 10°/min for 3 min. FID. Retention time: 9.39 min. Limit of detection, 200 µg/L [Semmes, Shen 1988]. Column: 10% Carbowax 6000 on Chromosorb WAW 80/100 (1.8 m [6 ft] × 2 mm i.d.). Temperature: 170°. FID. Limit of detection, 1 mg/L [Lin, Kelly 1985]. FID. Limit of detection, 1–2 mg/L [Krogh *et al.* 1995; Riva *et al.* 1982].

GC-MS Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 40° to 300° at 10°/min. EI ionisation at 70 eV. Limit of quantification, 300 µg/L [Deng *et al.* 2006].

HPLC Column: CN (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile: 40 µmol/L aqueous sodium dihydrogen phosphate (pH 3.5, 30: 70), flow rate 1 mL/min. UV detection (λ = 210 nm). Limit of quantification, 1.25 mg/L, limit of detection, 100 µg/L [Amini *et al.* 2006]. Column: Zorbax Eclipse XDB-C₈ (150 × 4.6 mm i.d.). Mobile phase: 30 mmol/L sodium acetate buffer (pH 4.8): acetonitrile (61.5: 38.5 for 4 min to 15: 85 at 20 min), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 325 nm, λ_{em} = 398 nm). Limit of quantification, 5.0 mg/L [Zhong *et al.* 2006]. See also Kushida, Ishizaki [1985], Liu *et al.* [1992] and van der Horst *et al.* [1988].

LC-MS Column: Non-porous silica. Mobile phase: ammonium acetate: methanol. MRM acquisition mode. Limit of quantification, 500 µg/L. Limit of detection, 170 µg/L [Matsuura *et al.* 2008]. Column: Thermo Beta Basic C₈ (500 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile-water (20: 80) containing 0.1% formic acid: acetonitrile-water (70: 30) containing 0.1% formic acid (100: 0 for 11 min to 0: 100 in 1 min for 4 min to 100: 0 in 1 min for 3 min), flow rate 0.2 mL/min. ESI, MRM acquisition mode. Limit of quantification, 200 µg/L [Cheng *et al.* 2007].

Serum GC Column: DB WAX capillary (30 × 0.25 mm i.d., 0.25 µm). Carrier gas: N₂, 1.2 and 45 mL/min. Temperature programme: 150° and 250°. FID. Limit of detection, 1.7 mg/L [Farajzadeh *et al.* 2009]. Column: cyanopropylphenyldimethylsiloxane fused silica (25 m × 0.22 mm i.d., 2.5 µm). Carrier gas: He, 1.8 mL/min. Temperature programme: 80° for 2 min to 140° at 15°/min for 1 min to 280° at 40°/min for 8 min. FID. Limit of detection, 800 µg/L [Shahdousti *et al.* 2007]. See Plasma [Lin, Kelly 1985].

GC-MS Column: OV-1701 bonded phase (25 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 15 psi. Temperature programme: 50° to 140° at 30°/min to 250° at 5°/min. Limit of detection, 2 µg/L [Kassahun *et al.* 1989]. Column: 3% OV-17 on 120/140 mesh Gas-Chrom Q (2 m × 2.5 mm i.d.). Temperature programme: 80° for 1 min to 140° at 12.5/min to 250° at 30°/min for 1 min. EI ionisation. Limit of detection, 2.8 to 18 µg/L [Nau *et al.* 1981].

HPLC Column: reversed phase C₁₈ (250 × 4.6 mm i.d.). Mobile phase: acetonitrile: 0.05 mol/L phosphate buffer, (pH 3.0, 45: 55 [v/v]), flow rate 1.2 mL/min. Limit of quantification, 1 mg/L [Kishore *et al.* 2003]. Column: YMC Pack ODS-A reversed phase. Fluorescence detection (λ_{ex} = 365 nm, λ_{em} = 440 nm). Limit of detection, 100 µg/L [Hara *et al.* 1999]. Column: HP Hypersil-ODS (100 × 2.1 mm i.d., 5 µm). Mobile phase: methanol: water (80: 20), flow rate 0.3 mL/min. DAD and fluorescence detection (λ_{ex} = 322 nm, λ_{em} = 695 nm). Limit of detection, 2.5 mg/L [Liu *et al.* 1992]. Column: Hypersil ODS (5 µm). Mobile phase: acetonitrile: water (65: 35), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 310 nm, λ_{em} = 405 nm). Limit of detection, 5 mg/L [Bousquet *et al.* 1991]. Column: Hypersil ODS (100 × 5.0 mm i.d., 5 µm). Mobile phase: acetonitrile: 0.003 mol/L potassium dihydrogen phosphate (30: 70), flow rate 2 mL/min. UV detection (λ = 254 nm). Limit of detection, 9 mg/L [Moody, Allan 1983].

LC-MS Column: Inertsil ODS C₁₈ (150 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium acetate buffer: methanol (15: 85), flow rate 1.0 mL/min. T-ESI, negative ion mode, SIM acquisition mode. Limit of quantification, 500 µg/L [Ramakrishna *et al.* 2005]. Column: Shim-pack CLC-ODS (150 × 4.6 mm i.d., 5 µm). Mobile phase: 90% methanol: 0.1 mol/L ammonium acetate buffer (pH 4.0, 96: 4), flow rate 1 mL/min. SIM acquisition mode. Limit of detection, 500 µg/L [Mino *et al.* 2001].

Urine GC-MS See Serum [Nau *et al.* 1981].

Breast Milk GC-MS See Serum [Nau *et al.* 1981].

Oral Fluid GC-MS See Serum [Kassahun *et al.* 1989].

Brain GC See Plasma [Dills, Shen 1997]. See Plasma. Limit of detection, 0.1 µg/g [Semmes, Shen 1988].

Disposition in the Body Valproic acid is well absorbed after oral administration; bioavailability is almost 100%. It is metabolised mainly by oxidation to a number of metabolites, including 3-oxovalproic acid, 2-propylglutaric acid, 3-hydroxyvalproic acid, 4-hydroxyvalproic acid, 5-hydroxyvalproic acid and valproic-1,4-lactone. Approximately 20% of a dose is excreted in the urine as the glucuronide of valproic acid in 72 h; most of the remainder is excreted as glucuronides of metabolites, <5% of a dose being excreted as unchanged drug.

Therapeutic Concentration In plasma, usually in the range 40–100 mg/L, but there is no clear correlation with therapeutic effect.

Following a single oral dose of 500 mg to 6 subjects, peak plasma concentrations of 36–73 mg/L (mean, 58) were attained in 1–5 h (mean, 3) [May, Garnett 1983].

Daily oral doses in the range 1–3.75 g were administered to 20 patients; at the end of 10 weeks, minimum serum concentrations were 30–135 mg/L (mean, 82) and maximum concentrations were 70–190 mg/L (mean, 109). Approximately 75% of the patients had serum concentrations within 55–100 mg/L [Bruni *et al.* 1978].

Rapid IV infusion of valproic acid in 21 subjects (dose range 21–28 mg/kg; mean, 24.2) at a rate of 3 or 6 mg/kg/min produced peak serum concentrations of 105–204.1 mg/L (mean, 132.6) 20 min after the end of infusion; in 2 subjects

the serum valproic acid levels were 64 and 74 mg/L at 30–40 min after the infusion [Venkataraman, Wheless 1999].

Toxicity Plasma concentrations >200 mg/L are associated with toxic effects but valproic acid is relatively non-toxic after overdose and recovery after the ingestion of up to 75 g has been reported. Hepatotoxicity has been reported during therapeutic administration.

A 43-year-old female recovered following haemodialysis after becoming comatose owing to ingesting a large amount of valproic acid; her serum valproic acid concentration on admission to hospital was 1380 mg/L [Johnson *et al.* 1999].

A 25-year-old female became comatose after ingesting an unknown quantity of valproic acid (concentrations increased to >1200 mg/L); she was successfully treated with haemodialysis [Kane *et al.* 2000].

A multicentre case series study of valproic acid intoxication revealed that, of 335 reports, 186 had serum levels of >100 mg/L. Peak serum valproic acid concentrations were 110–1840 mg/L (mean, 378.3) at 1–18 h (mean, 7.4). A peak concentration of >850 mg/L was more likely to be associated with coma, respiratory depression, aspiration or metabolic acidosis [Spiller *et al.* 2000].

Half-life Plasma half-life, ~6–20 h, reduced when administered in combination with other anticonvulsants.

Volume of Distribution ≈0.1–0.2 L/kg.

Clearance Plasma clearance, ~0.1–0.3 mL/min/kg.

Distribution in Blood Plasma: whole blood ratio, ~1.8.

Protein Binding Approximately 90% (concentration dependent; decreased at plasma concentration >100 µg/mL).

Note For a review of the clinical pharmacokinetics of valproic acid, see Gugler, von Unruh [1980]; for a review of its toxicity, see Sztajnkrycyer [2002]; for a review of its pharmacological and therapeutic properties, see Perucca [2002].

Dose Initially 600 mg of sodium valproate daily, increasing to 2.6 g daily.

Valsartan

Angiotensin II Receptor Antagonist

C₂₄H₂₉N₅O₃ = 435.5

CAS—137862-53-4

IUPAC Name (2S)-3-Methyl-2-[pentanoyl-[[4-[2-(2H-tetrazol-5-yl)phenyl]phenyl]methyl]amino]butanoic acid

Synonyms CGP-48933; N-[p-(o-1H-tetrazol-5-ylphenyl)benzyl]-N-valeryl-L-valine.

Proprietary Names Diovan; Tareg.

Chemical Properties A white to practically white fine powder. Mp 116° to 117°. Soluble in ethanol and methanol; slightly soluble in water.

Gas Chromatography System GP—RI 3420valsartan-ME₂.

High Performance Liquid Chromatography Column: Chiral AGP (ChromTech) silica bonded α₁-acid glycoprotein (100 × 4 mm i.d., 5 μm). Mobile phase: phosphate buffer (pH 7.0, containing 2% 2-propanol), flow rate 0.8 mL/min. UV detection (λ=227 nm). Retention time: 10 min; CGP 49309, 6 min [Francotte *et al.* 1996].

Ultraviolet Spectrum Aqueous acid—203, 248 nm.

Mass Spectrum Principal ions at *m/z* 264, 378, 192, 250, 320, 58, 165, 251 (valsartan-ME₂).

Quantification

Plasma HPLC Fluorometric detection. Limit of quantification, 5 μg/L [Brookman *et al.* 1997]. Column: ODS Hypersil C₁₈ (150 × 4.6 mm i.d., 5 μm). Mobile phase: phosphate buffer (pH 2.8): acetonitrile (50:50), flow rate 1.3 mL/min. Fluorescence detection (λ_{ex}=265 nm; λ_{em}=378 nm). Retention time: 5 min. Limit of quantification, 5 μg/L [Sioufi *et al.* 1994].

Urine GC-MS Limit of detection, 10 μg/L [Maurer *et al.* 1998].

HPLC See Plasma. Limit of quantification, 10 μg/L [Brookman *et al.* 1997]. See Plasma. Limit of quantification, 10 μg/L [Sioufi *et al.* 1994].

Bile HPLC See Plasma. Limit of quantification, 10 μg/L [Brookman *et al.* 1997]. See Plasma. Limit of quantification, 10 μg/L [Sioufi *et al.* 1994].

Disposition in the Body Valsartan is rapidly absorbed following oral administration. It is quickly eliminated from the body and no significant metabolism takes place. A pharmacologically inactive metabolite, valeryl-4-hydroxyvalsartan, is formed by oxidative biotransformation, accounting for 9% of the dose, and can be detected in plasma after 2 h. Following an oral dose, 86% is excreted in faeces, mainly as the unchanged drug and 13% in urine, 10% as the unchanged drug. After IV administration, 30% of a dose is detected unchanged in urine. The bulk of the drug is excreted within 4 days; and 99% of a dose is excreted in 7 days. The drug displays linear pharmacokinetics. Little accumulation occurs following multiple dosing.

Therapeutic Concentration

A peak plasma concentration of 1.64 mg/L occurs in 2 h following a single 80 mg dose and 3.46 mg/L following 200 mg [Markham, Goa 1997].

Twelve patients, 6 with mild impairment of liver function and 6 with moderate impairment, and 12 healthy individuals were orally administered a single dose of 160 mg valsartan. The patients with mild impairment produced mean peak concentrations of 5.91 (range, 4.06 to 7.16) mg/L at 3.5 h; those with moderate impairment, 3.91 (2.44 to 6.5) mg/L at 4.0 h and the healthy individuals produced peak concentrations of 3.30 (1.27 to 5.12) mg/L at 2.5 h [Brookman *et al.* 1997].

Bioavailability 23%.

Half-life Mean 7.5 h (range, 5 to 9 h).

Volume of Distribution Steady state, 16.9 L.

Clearance Plasma, 2.2 L/h.

Protein Binding 94 to 97% mainly to albumin.

Dose Usually 80 to 160 mg and a maximum of 320 mg.

Vancomycin

Antibiotic

C₆₆H₇₅Cl₂N₉O₂₄ = 1449.3

CAS—1404-90-6

Chemical Properties An amphoteric glycopeptide antimicrobial substance produced by the growth of certain strains of *Streptomyces orientalis*.

Vancomycin Hydrochloride

C₆₆H₇₅Cl₂N₉O₂₄·HCl = 1485.7

CAS—1404-93-9

Proprietary Names Balcoran; Diatracin; Edicin; Glipep; Lypocin; Orivan; Vancocin(e); Vancocina; Vancoled; Vancoscand; Vancox

Chemical Properties A light brown powder. Soluble 1 in 10 of water; moderately soluble in dilute methanol; insoluble in higher alcohols, acetone and ether.

Colour Test Marquis test—yellow.

Thin-layer Chromatography System TA— R_f 0.22 (acidified potassium permanganate solution, positive).

Ultraviolet Spectrum Vancomycin hydrochloride: aqueous acid—281 nm ($A_1=34b$).

Quantification

Plasma HPLC Electrochemical detection. For comparison with EMIT, see Favetta *et al.* [2001]. UV detection. For comparison with FPIA, see Farin *et al.* [1998]. UV detection. Bone Atrial Appendage Tissue HPLC See Plasma. Limit of detection, 0.75 µg/g [Greene *et al.* 1987].

Tissue HPLC See Plasma [Farin *et al.* 1998].

Disposition in the Body Not absorbed from the gastrointestinal tract. About 90% of an IV dose is excreted in the urine with about 50% of the dose being excreted in 4 h.

Therapeutic Concentration In plasma, usually in the range 10 to 40 mg/L.

In 101 infants who received vancomycin 15 mg/kg by IV infusion over 60 min, every 12 or 18 h, trough serum concentrations of 0.6 to 23.4 mg/L (median, 7.1) and peak serum concentrations of 9.0 to 47.2 mg/L (median, 25.5) were attained. Target trough concentrations of 1 to 10 mg/L were achieved by 46.5% and 1 to 12 mg/L by 55.4%; peak concentrations of 20 to 40 mg/L were found in 83.2% and 15 to 60 mg/L in 99.0% [Tan *et al.* 2002].

Half-life Plasma half-life, about 4 to 10 h.

Volume of Distribution About 0.4 to 1 L/kg.

Clearance Plasma clearance, about 1 mL/min/kg.

Protein Binding About 55%.

Note For a review of vancomycin, see Cunha and Ristuccia [1983].

Dose The equivalent of up to 2 g of vancomycin daily, orally or by IV infusion.

Vanillin

Flavouring Agent

$C_8H_8O_3 = 152.1$

CAS—121-33-5

IUPAC Name 4-Hydroxy-3-methoxybenzaldehyde

Synonyms Vainillina; vanillic aldehyde; vanillinum.

Chemical Properties White or slightly yellow crystalline needles or powder. Mp 81° to 83°. Soluble 1 in 100 of water; freely soluble in ethanol, chloroform and ether; soluble in glycerol and hot water. pK_a 7.4 (20°). Log *P* (octanol/water), 1.2.

Gas Chromatography System GA—RI 1630; system GB—RI 1632; system GN—retention time 86.5 min.

High Performance Liquid Chromatography System HAA—retention time 11.7 min.

Ultraviolet Spectrum Aqueous acid—230, 278 ($A_1=685b$), 309 nm; aqueous alkali—248, 348 nm ($A_1=1640b$).

Infrared Spectrum Principal peaks at wavenumbers 1660, 1153, 1267, 735, 1590, 1300 cm^{-1} (KCl disk).

Mass Spectrum Principal ions at *m/z* 152, 151, 81, 109, 51.

Quantification

Plasma HPLC UV detection. Limit of detection, 1 mg/L for vanillin and vanillic acid [Farthing *et al.* 1999].

Urine HPLC See Plasma [Farthing *et al.* 1999].

Red Blood Cells HPLC See Plasma [Farthing *et al.* 1999].

Vardenafil

Phosphodiesterase 5 Inhibitor, Treatment of ED

$C_{23}H_{32}N_6O_4S = 488.6$

CAS—224785-90-4

IUPAC Name 2-[2-Ethoxy-5-(4-ethylpiperazin-1-yl)sulfonylphenyl]-5-methyl-7-propyl-1*H*-imidazo[5,1-*f*][1,2,4]triazin-4-one

Synonyms 1-[3-(1,4-Dihydro-5-methyl-4-oxo-7-propylimidazo-[5,1-f][1,2,4] triazin-2-yl)-4-ethoxy-phenyl]sulfonyl-4-ethyl-piperazine; 4-(2-ethoxy-5-(4-ethyl-piperazin-1-yl)sulfonyl-phenyl)-9-methyl-7-propyl-; 3,5,6,8-tetraazabicyclo[4.3.0]nona-3,7,9-trien-2-one.

Vardenafil Dihydrochloride

$C_{23}H_{32}N_6O_4S \cdot 2HCl = 561.5$
CAS—224789-15-5

Vardenafil Hydrochloride Trihydrate

$C_{23}H_{32}N_6O_4S \cdot HCl \cdot 3H_2O = 579.1$
CAS—330808-88-3; 224785-91-5 (anhydrous)

Synonym Bay-38-9456

Proprietary Names Levitra; Nuviva.

Chemical Properties Almost colourless solid. Mp 218°. Slightly soluble in water. pK_{a1} 3.4, pK_{a2} 6.7, pK_{a3} 8.8 [Rajagopalan *et al.* 2003]. Pure samples are stable when refrigerated or frozen. Plasma samples are stable at 20° for up to 4 h, at 4° for up to 24 h and at -20° for up to 28 days. Samples are stable following freeze-thaw and in processed samples left at room temperature for up to 16 h [Cheng *et al.* 2007].

Mass Spectrum Principal ions at m/z 489, 490, 283, 134, 311, 491.

Quantification

Blood LC-MS Mobile phase: acetonitrile : buffer (70 : 30), flow rate 1.0 mL/min. APCI. Limit of quantification, 0.39 µg/L; limit of detection, 0.19 µg/L [Johnson *et al.* 2007].

Bile LC-MS See Blood [Johnson *et al.* 2007].

Kidney LC-MS See Blood [Johnson *et al.* 2007].

Liver LC-MS Mobile phase: acetonitrile:buffer (70:30), flow rate 1.0 mL/min. APCI. Limit of quantification, 0.39 µg/L; limit of detection, 0.19 µg/L [Johnson *et al.* 2007].

Skeletal Muscle LC-MS See Blood [Johnson *et al.* 2007].

Heart Muscle LC-MS See Blood [Johnson *et al.* 2007].

Other HPLC Rat Plasma and Bile. Column: Hypersil-100 C_{18} (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile:50 mmol/L ammonium acetate (pH 6.8; 40:60), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 280 nm, λ_{em} = 470 nm). Limit of detection, 0.2 mg/L [Cheng *et al.* 2007]. Dietary Supplements. Column: C_{18} silica (5 µm). Mobile phase: acetonitrile:20 mmol/L ammonium acetate and 0.2% formic acid (35:65 for 10 min to 80:20 at 15 min for 5 min to 100:0 for 5 min to 35:65 for 10 min), flow rate 1 mL/min. UV detection (λ = 292 nm). Limit of detection, 1.1 µg/L [Zhu *et al.* 2005].

LC-MS Dietary Supplements. Column: Zorbax stable bond C_{18} (150 × 2.1 mm, 5 µm). Mobile phase: acetonitrile:0.1% formic acid in water (15:85 for 5 min to 90:10 at 15 min for 5 min), flow rate 400 µL/min. ESI, positive ion mode. Limit of detection, 1.4 mg/L [Gratz *et al.* 2004].

CE Pharmaceutical Formulations. Capillary: fused silica (60 cm × 75 µm i.d.). Electrolyte buffer: 10 mmol/L phosphate buffer (pH 12) with 25 mmol/L SDS. UV detection (λ = 222 nm). Limit of quantification, 1 mg/L [Rodríguez Flores *et al.* 2004].

Disposition in the Body Vardenafil is rapidly absorbed after administration, with peak plasma concentrations reached by 30 min to 2 h. Drug concentrations can decrease when the drug is administered with food. It is metabolised by a number of hepatic enzymes but predominantly by CYP3A4. The enzymes CYP3A5 and CYP2C also contribute to the metabolism of the drug. Desethylation of vardenafil results in M1 (major circulating metabolite), which is pharmacologically active with an estimated efficacy contribution of around 7%. Vardenafil can be extensively distributed between tissues and is excreted as metabolites in faeces (91 to 95% of dose) and also in urine (2 to 6%).

Therapeutic Concentration

Twenty-five healthy males were administered a single 20 mg dose after an overnight fast, after a high fat breakfast, in the evening on an empty

stomach, or after an evening meal with a moderately high fat content. Mean peak plasma drug concentrations reached 17.1, 14.0, 14.2 and 13.0 µg/L, respectively, after 0.5 to 4 h. Metabolite concentrations reached 17.4, 9.3, 15.3 and 14.0 µg/L, respectively, for the four groups, [Rajagopalan *et al.* 2003].

Toxicity

Postmortem analysis of fluid and tissue samples from a victim of an aviation accident yielded the following levels:

Specimen	Concentration (µg/L or µg/kg)
Heart blood	291
Bile	1665
Liver	86
Kidney	15
Skeletal muscle	8
Heart muscle	26
Lung	234

Postmortem redistribution could explain the abnormally high blood concentration [Johnson *et al.* 2007].

Administration of 5 mg vardenafil in addition to ritonavir 600 mg twice daily resulted in a 13-fold increase in vardenafil peak plasma concentrations. Similar effects have been observed with concomitant administration of vardenafil with ketoconazole or erythromycin [Keating, Scott 2003].

Bioavailability Absolute, 20%.

Half-life Elimination, 4 to 5 h.

Volume of Distribution 208 L at steady state.

Clearance Total body, 56 L/h.

Protein Binding Approximately 95%.

Dose Vardenafil hydrochloride trihydrate, 10 to 20 mg daily.

Vedaprofen

Propionic Acid, NSAID

$C_{19}H_{22}O_2 = 282.4$

CAS—71109-09-6

IUPAC Name 2-(4-Cyclohexylnaphthalen-1-yl)propanoic acid

Synonyms CERM-10202; (±)-4-cyclohexyl-α-methyl-1-naphthalene acetic acid; 2-(4-cyclohexyl-1-naphthyl)-propionic acid; PM-150.

Proprietary Name Quadrisol

Chemical Properties Crystals. Mp 150°.

Quantification No data have been reported for vedaprofen concentrations in human fluids or tissues.

Other GC-MS Horse Faeces. Column: DB5-MS (30 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 100° for 0.5 min to 220° at 15°/min, to 305° at 8°/min for 8 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 10 µg/g [Popot *et al.* 2006].

HPLC Horse Plasma. Column: Lichrosorb C_{18} (100 mm). Mobile phase: acetonitrile:water (65:35) in 1% acetic acid, flow rate 0.6 mL/min. UV detection (λ = 288 nm). Limits of detection, 3 µg/L for the (R)-enantiomer and 6 µg/L for the (S)-enantiomer [Lees *et al.* 1999].

Dose Used in veterinary medicine for the treatment of inflammation and pain. It is available as a 100 mg/mL gel.

Lees P *et al.* (1999). A pharmacodynamic and pharmacokinetic study with vedaprofen in an equine model of acute nonimmune inflammation. *J Vet Pharmacol Ther* 22: 96–106.
 Popot MA *et al.* (2006). Use of accelerating solvent extraction for detecting non-steroidal anti-inflammatory drugs in horse feces. *J Anal Toxicol* 30: 323–330.

Venlafaxine

Antidepressant, Phenethylamine, Serotonin/Noradrenaline Reuptake Inhibitor (SNRI)

$C_{17}H_{27}NO_2 = 277.4$

CAS—93413-69-5

IUPAC Name 1-[2-(Dimethylamino)-1-(4-methoxyphenyl)ethyl]cyclohexan-1-ol
Synonym Venlafaxine

Chemical Properties Both (–)– and (+)–forms crystallise from ethyl acetate. Mp 102° to 104°. Log *P* (octanol/water), 3.28 [Meylan, Howard 1995], 2.68 [Matoga *et al.* 2001], 2.9 [Rodda, Drummer 2006], 0.43. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005]. Stock solutions stable at room temperature for 7 h and at 4° for 25 days. Stable in methanol : water (50 : 50) for 24 days. Stable in plasma at room temperature for up to 24 h and after 6 freeze-thaw cycles [Patel *et al.* 2008]. Stable in methanol at 4° and room temperature for at least 48 h. Stable in plasma when stored at –20° in polypropylene tubes for at least 74 days [Theron *et al.* 2007]. Stock solution in methanol is stable at 4° for a week. Plasma samples were stable at –20° for 14 days and after 5 freeze-thaw cycles [Wei *et al.* 2007]. Serum samples were stable for a minimum of 4 months at –20° and a minimum of 4 days at room temperature [Reis *et al.* 2002]. Venlafaxine is stable at –20° for 15 days, at 4° for 48 h and 20° for 24 h [Matoga *et al.* 2001]. Venlafaxine is stable at –20° for at least 370 days in human plasma, 182 days in rat and dog plasma, and 91 days in human urine [Hicks *et al.* 1994].

Venlafaxine Hydrochloride

$C_{17}H_{27}NO_2 \cdot HCl = 313.9$

CAS—99300-78-4

Synonym Wy-45030

Proprietary Names *Dobupal; Eflexor; Effexor; Trevilor; Trewilor; Vandral.*

Chemical Properties A white to off-white crystalline solid. Mp 215° to 217°. It is soluble in water at 572 g/L. The (–)– and (+)–forms crystallise from methanol/ether. Mp 240°.

Gas Chromatography System GB—venlafaxine RI 2163, M (*N*-desmethyl-) RI 2196, M (*O*-desmethyl-) RI 2230, M (*NO*-didesmethyl) RI 2264, M (nor-OH-) RI 2450, M (*O*-desmethyl OH-) isomer 1 RI 2373, M (*O*-desmethyl OH-) isomer 2 RI 2408; system GM—venlafaxine RRT 0.544, M (*N*-desmethyl-) RRT 0.570, M (*O*-desmethyl-) RRT 0.625, M (*N,O*-didesmethyl) RRT 0.687 (all relative to iprindole).

High Performance Liquid Chromatography System HZ—venlafaxine RT 3.1, M (*O*-desmethyl-) RT 2.2 min.

Ultraviolet Spectrum Aqueous acid (0.2 mol/L sulfuric acid)—225, 273, 280 nm; (0.025 mol/L sulfuric acid)—226.5, 274.5 nm; basic—274, 280 nm.

Infrared Spectrum Principal peaks at wavenumbers 1513, 1243, 1179 cm^{-1} (venlafaxine hydrochloride; KBr pellet).

Mass Spectrum Principal ions at *m/z* 58, 134, 91, 121, 179, 42, 77, 277.

Quantification

Blood GC Column: DB-17 (30 m × 0.32 mm i.d., 0.25 μm) or HP-5 (30 m × 0.32 mm i.d., 0.25 μm). Temperature programme: 120° for 1 min to 280° at 8°/min [Long *et al.* 1997].

GC-MS Column: DB-5 cross-linked 5% phenylmethylsiloxane (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 50° for 2 min to 180° at 30°/min to 280° at 5°/min for 19 min. Full scan mode. Retention time: 15.7 min. Limit of quantification, 0.05 mg/L [Paterson *et al.* 2004].

HPLC Column: XTerra RP18 (100 × 2.1 mm i.d.). Mobile phase: acetonitrile : 4 mmol/L ammonium formate buffer (pH 3.2, 15 : 85 for 1 min to 35 : 65 over 12 min for 1 min), flow rate 1 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 5 μg/L [Castaing *et al.* 2007]. Column: Novapak phenyl (150 × 3.9 mm i.d., 5 μm). Mobile phase: acetonitrile : 10 mmol/L potassium phosphate buffer (pH 3.0, 55 : 45), flow rate 1.5 mL/min. UV detection (λ = 214 nm). Limit of detection, 1 mg/L [Jaffe *et al.* 1999]. Column: ODS (150 × 4.6 mm i.d., 5 μm). Mobile phase: phosphate buffer (pH 4.0) : methanol (71 : 29), flow rate 1 mL/min. DAD (λ = 220 nm) [Long *et al.* 1997].

LC-MS Column: Zorbax Extend C_{18} (150 × 2.1 mm i.d., 5.0 μm). Mobile phase: 0.05 mol/L ammonia : methanol : tetrahydrofuran (pH 10.0, 32.5 : 67.0 : 0.5), flow rate 0.25 mL/min. MSD, SIM acquisition mode, positive ion mode. Limit of quantification, 50 ng/g [Goeringer *et al.* 2001].

Plasma GC Column: HP-5 cross-linked 5% phenylmethyl silicone (25 m × 0.32 mm i.d., 0.17 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 150° for 1 min to 250° at 5°/min. NPD. Limit of detection, 0.1 mg/L [Levine *et al.* 1996].

GC-MS Column: J, W-5 MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.3 mL/min. Temperature programme: 90° for 1 min to 180° at 50°/min for 10 min to 300° at 10°/min for 2.5 min. EI ionisation at 70 eV, MSD, SIM acquisition mode. Limit of quantification, 9 μg/L [Wille *et al.* 2007]. Column: Varian factor FOUR VF-5 ms (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.3 mL/min. Temperature programme: 90° for 0.5 min to 180° at 50°/min for 10 min to 300° at 10°/min for 10 min. EI ionisation at 70 eV, MSD, SIM acquisition mode. Limit of detection, not reported [Wille *et al.* 2005].

HPLC Column: Diamonsil C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : phosphate buffer (pH 3.0) : TEA (33.5 : 66.5 : 0.4), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 276 nm, λ_{em} = 596 nm). Limit of quantification,

10 µg/L, limit of detection, 2.0 µg/L [Qin *et al.* 2008]. Column: Zorbax C₈ (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile (pH 6.8): 40 mmol/L phosphate buffer containing 0.25% TEA (25:75), flow rate 1.0 mL/min for 3.5 min to 2.0 mL/min at 4 min for 11 min to 1.0 mL/min at 15.5 min. Fluorescence detection (λ_{ex} = 238 nm, λ_{em} = 300 nm). Limit of quantification, 1.0 µg/L, limit of detection, 0.3 µg/L [Mandrioli *et al.* 2007]. Column: Hypurity C₁₈ (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile: phosphate buffer (pH 3.8, 25:75 to 40:60 in 10 min to 44:66 in 8 min), flow rate 1.0 mL/min. DAD (λ = 290 nm). Retention time: 8.2 min. Limit of quantification, 25 µg/L, limit of detection, 2 µg/L [Duverneuil *et al.* 2003]. Column: Symmetry C₈ (250 × 4.6 mm i.d.). Mobile phase: acetonitrile: 10 mmol/L phosphate buffer (pH 3.8, 25:75 to 36:64 over 7 min to 25:75 for 3 min), flow rate 1 mL/min. UV detection (λ = 230 to 290 nm for 1.5 min to 230 nm). Retention time: 7.0 min. Limit of quantification, 100 µg/L [Titier *et al.* 2003]. Column: Spherisorb S5 C₈ (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile: 62.4 mmol/L phosphate buffer with diethylamine and Pic B5 (pH 5.5, 30:70), flow rate 1.4 mL/min. UV detection (λ = 229 nm). Limit of quantification, 100 µg/L [Matoga *et al.* 2001].

LC-MS Column: Xbridge C₁₈ (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: 20 mmol/L ammonium acetate (pH 8.1): acetonitrile (84:16 to 66.5:33.5 at 1.31 min to 40:60 from 7.51 to 10.9 min to 15:85 from 11 to 13 min to 84:16 for 5 min), flow rate 300 µL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 2 µg/L [Choong *et al.* 2009]. Column: Zorbax SB C₁₈ (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol: 5 mmol/L ammonium acetate (80:20), flow rate 1.0 mL/min. ESI, TIS, positive ion mode. Retention time: 1.6 min. Limit of quantification, 4.005 µg/L [Rajasekhar *et al.* 2009]. Column: Sunfire C₁₈ (20 × 2.1 mm i.d., 3.5 µm). Mobile phase: 2 mmol/L ammonium formate (pH 3.0): acetonitrile (85:15 for 0.5 min to 50:50 at 4 min to 30:70 at 5 min for 3 min), flow rate 0.4 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 0.77 min. Limit of quantification, 2 µg/L [De Castro *et al.* 2008]. Column: Hypurity cyano (50 × 4.6 mm i.d., 5.0 µm). Mobile phase: methanol: water: 1.0 mol/L ammonium trifluoroacetate (350:650:1.5), flow rate 700 µL/min. APL, TIS, positive ion mode, MRM acquisition mode. Limit of detection, 2 µg/L [Patel *et al.* 2008]. Column: BDS Hypersil C₁₈ (250 × 4.6 mm i.d., 5 µm). Mobile phase: 30 mmol/L ammonium acetate-2.6 mmol/L formic acid-0.13 mmol/L trifluoroacetic acid: acetonitrile (60:40 to 46:54 at 7 min to 60:40 at 7.1 min to 40:60 at 8.5 min), flow rate 1.0 mL/min for 7 min to 1.5 mL/min at 7.1 min for 1.4 min. ESI, positive ion mode, SIR acquisition mode. Limit of quantification, 3.5 µg/L [Liu *et al.* 2007a]. Column: CHIROBIC V (250 × 4.6 mm i.d., 5 µm). Mobile phase: 30 mmol/L ammonium acetate: methanol (15:85, pH 6.0), flow rate 1.0 mL/min. ESI, positive ion mode, SIR acquisition mode. Limit of quantification, 5.0 and 5.2 µg/L for (S)-(+)- and (R)-(-)-venlafaxine, respectively, limit of detection, 1.0 µg/L [Liu *et al.* 2007b]. See also Bhatt *et al.* [2005], Juan *et al.* [2005], Smyth *et al.* [2006], Theron *et al.* [2007] and Wei *et al.* [2007].

Serum HPLC Column: C₁₈. Mobile phase: acetonitrile: buffer (30:70), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex} = 227 nm, λ_{em} = 300 nm). Limit of quantification, 14.8 µg/L, limit of detection, 4.93 µg/L [Waschglar *et al.* 2004]. Column: Nucleosil 100-5-Protect 1 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 25 mmol/L potassium dihydrogen phosphate (pH 7.0): acetonitrile (60:40), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Retention time: 7.3 min. Limit of detection not reported [Frahner *et al.* 2003]. Column: Lichrosphere RP-select B (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol: acetonitrile: 20 mmol/L potassium dihydrogen phosphate (pH 4.4, 10:20:70), flow rate 1.0 mL/min. Limit of quantification, 20 nmol/L [Reis *et al.* 2002]. Column: Beckman ODS C₁₈ (250 × 4.6 mm i.d.). Mobile phase: acetonitrile: 0.05 mol/L sodium phosphate buffer (pH 3.8, 50:50), flow rate 1 mL/min. UV detection (λ = 200.4 nm). Retention time: 4.46 min. Limit of detection, 25 ng [Tournel *et al.* 2001].

LC-MS Column: Chromolith Speed ROD C₁₈ (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol: 5 mmol/L acetic acid (pH 3.9) in ammonia (20:80 to 70:30 at 4 min for 1 min to 20:80), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 12.7 µg/L [Kirchherr, Kühn-Velten 2006].

Urine GC See Plasma [Levine *et al.* 1996].

GC-MS Column: CP-SIL 8 CB (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 60° for 2 min to 200° at 20°/min to 280° at 5°/min. EI ionisation at 70 eV, positive ion mode. Limit of detection, 0.21 µg/L [Salgado-Petinal *et al.* 2005]. Column: HP-1 cross-linked methyl silicone (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 8 min. EI ionisation at 70 eV. Limit of detection, <100 µg/L [Bickeboeller-Friedrich, Maurer 2001].

HPLC See Blood [Jaffe *et al.* 1999]. See Plasma. Limit of detection, 100 µg/L [Hicks *et al.* 1994]. Column: Supelco LC-18-DB (250 × 4.6 mm i.d., 5 µm). Mobile phase: 100 mmol/L sodium dihydrogen phosphate: acetonitrile (90:10 to 60:40), flow rate 1.0 mL/min. UV detection (λ = 229 nm). Limit of detection not reported [Howell *et al.* 1993].

Disposition in the Body Venlafaxine is well absorbed after oral administration and undergoes extensive first-pass metabolism in the liver, mainly to the active metabolite *O*-desmethylvenlafaxine by P450 CYP2D6 [Fukuda *et al.* 2000]. Two lesser active minor metabolites are also produced: *N*-desmethylvenlafaxine and *N*,*O*-didesmethylvenlafaxine. Venlafaxine is excreted predominantly in urine, mainly in the form of its metabolites (either free or conjugated), 1–10% as the unchanged drug, 30% *O*-desmethylvenlafaxine, 6–19% *N*,*O*-didesmethylvenlafaxine and 1% *N*-desmethylvenlafaxine. Approximately 2% is excreted in faeces. It is not removed by dialysis. The serum therapeutic range is 250–750 µg/L for the total drug and metabolites.

Therapeutic Concentration

Eighteen healthy male volunteers (mean age of 27 years) were administered single oral doses of 25, 75 or 150 mg on day 1, and the same dose every 8 h on days 2 to 4. A single dose was then administered on day 5. The mean peak concentrations from day 1 were 37, 102 and 163 µg/L, respectively, for the 3 doses, attained at 2.4, 2.1 and 2.1 h, respectively. The mean peak *O*-desmethylvenlafaxine concentrations were 61, 168 and 325 µg/L, respectively, for the three doses, attained at 4.0 h (range, 1.5–7.8), 4.4 h (range, 1.2–6.7) and 4.6 h (range, 3.1–5.9) respectively [Klamerus *et al.* 1992].

Toxicity The toxic range is 1.0–1.5 mg/L for the drug and metabolites together. A 21-year-old woman ingested ~14.7 g venlafaxine. Postmortem venlafaxine and *O*-desmethylvenlafaxine concentrations were 95 and 8 mg/L, respectively, in femoral blood [Hojer *et al.* 2008].

A 39-year-old woman ingested a large undefinable amount of venlafaxine. Postmortem venlafaxine and *O*-desmethylvenlafaxine concentrations were 79 and 17.7 mg/L, respectively, in femoral blood [Hojer *et al.* 2008].

A 13-year-old girl ingested 48 tablets of 150 mg venlafaxine. A serum sample obtained after 3 h revealed a venlafaxine concentration of 24 460 µg/L and an *O*-desmethylvenlafaxine concentration of 3930 µg/L [Bond *et al.* 2003]. A 39-year-old woman ingested 30 g of extended-release venlafaxine capsules. Concentrations of venlafaxine and desmethylvenlafaxine were as follows:

Day after ingestion	Venlafaxine (mg/L)	<i>O</i> -Desmethylvenlafaxine (mg/L)
1	21.82	3.33
2	10.36	1.44
3	13.33	1.94
4	12.11	2.07
7	2.39	1.04
8	2.43	0.84
10	0.42	0.18
11	0.19	0.11
12	0.10	0.07
13	0.04	0.02
16	<0.03	<0.03

[Mazur *et al.* 2003]

Postmortem drug concentrations were reported for 2 women who died after taking venlafaxine [Jaffe *et al.* 1999]. The first woman was 41 years old and took 84 tablets of 75 mg venlafaxine. The second was 36 years of age and took 56 tablets of 75 mg venlafaxine. The following concentrations were found at postmortem:

	Case 1	Case 2
Blood (mg/L)	53	78
Liver (mg/kg)	81	110
Bile (mg/L)	90	200
Vitreous humour (mg/L)	22	58
Urine (mg/L)	9	NA
Gastric contents (mg)	NA	400

NA, not analysed

Two venlafaxine-related deaths were reported [Long *et al.* 1997]. Blood concentrations in the first were 7.27 mg/L venlafaxine, and 6.03 mg/L *O*-desmethylvenlafaxine. Blood concentrations in the second were 84.30 mg/L venlafaxine and 3.44 mg/L *O*-desmethylvenlafaxine.

In 3 postmortem cases, heart blood concentrations were 6.6, 84, and 44 mg/L [Levine *et al.* 1996].

Half-life Plasma half-life: venlafaxine 4 h, *O*-desmethylvenlafaxine 10 h.

Volume of Distribution 8 L/kg [Rodda, Drummer 2006]; venlafaxine 6.8 L/kg; *O*-desmethylvenlafaxine 5.7 L/kg.

Clearance Plasma clearance: venlafaxine 1.2–1.7 L/h/kg, *O*-desmethylvenlafaxine 0.4 L/h/kg; decreased by ~55% in patients on dialysis [Troy *et al.* 1994].

Milk: plasma ratio 4.14 [Ilett *et al.* 1998].

Protein Binding 27% [Rodda, Drummer 2006]; venlafaxine and *O*-desmethylvenlafaxine, 30%.

Note For a review of venlafaxine see Holliday, Benfield [1995].

Dose The usual dose is 75 mg venlafaxine daily with a maximum of 375 mg. The dose is reduced by 50% in those with moderate hepatic impairment and by 25% in mild to moderate renal impairment.

Verapamil

Antiarrhythmic

C₂₇H₃₈N₂O₄ = 454.6
CAS—52-53-9

IUPAC Name 2-(3,4-Dimethoxyphenyl)-5-[2-(3,4-dimethoxyphenyl)ethylmethylamino]-2-propan-2-ylpentanenitrile

Synonyms CP-16533-1; D-365; iproveratril.

Chemical Properties A pale yellow viscous oil. Practically insoluble in water; freely soluble in the lower alcohols, acetone, ethyl acetate and chloroform; soluble in benzene and ether. pK_a 8.9. Log P (octanol/water), 3.8. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Verapamil Hydrochloride

C₂₇H₃₈N₂O₄·HCl = 491.1
CAS—152-11-4

Proprietary Names *Angimon*; *Berkatens*; *Calan*; *Cordilox*; *Covera*; *Half Securon*; *Isoptin(e)*; *Securon*; *Univer*; *Verapress*; *Verelan*; *Vertab*; *Zolvera*.

Chemical Properties A white crystalline powder. Mp 138.5° to 140.5°, with decomposition. Soluble 1 in 20 of water, 1 in 25 of ethanol and 1 in 1.5 of chloroform; practically insoluble in ether.

Colour Tests Liebermann’s reagent—black; Marquis test—yellow-green→grey. **Thin-layer Chromatography** System TA—R_f 0.59; system TB—R_f 0.23; system TC—R_f 0.70; system TE—R_f 0.73; system TL—R_f 0.42; system TAE—R_f 0.43; system TAF—R_f 0.61 (acidified iodoplatinate solution—positive).

Gas Chromatography System GA—verapamil RI 3150, M (nor-) RI 3180, M (*N*-desalkyl-) RI 2100, M (*N*-desalkyl-acetyl-) RI 2460, M (*N*-didesalkyl-acetyl-) RI 2545; system GB—verapamil RI 3305, M (nor-) RI 3371, M (*N*-desalkyl-) RI 2193, M (*O*-desmethyl-didesalkyl-) RI 2169, M (*O*-desmethyl-desalkyl-) RI 2246, M (didesalkyl-) RI 2300, M (*N*-desalkyl-acetyl-) RI 2546, M (*N*-didesalkyl-acetyl-) RI 2579.

High Performance Liquid Chromatography System HA—verapamil *k* 2.6, M (nor-) *k* 1.7; system HX—RI 447; system HY—RI 386; system HZ—verapamil RT 7.0 min, M (nor-) RT 6.6 min; system HAA—RT 15.4 min; system HAV—*k* 8.2; system HAX—RT 13.3 min; system HAY—RT 7.0 min [Stagni, Gillespie 1995].

Ultraviolet Spectrum Aqueous acid—278 nm (A₁ = 127a).

Infrared Spectrum Principal peaks at wavenumbers 1510, 1253, 1026, 1232, 1149, 1587 cm^{-1} (thin film).

Mass Spectrum Principal ions at m/z 303, 58, 43, 304, 151, 44, 42, 57.

Quantification

Blood HPLC Column: Nova-Pak C_{18} RP (150 \times 3.9 mm i.d., 4 μm). Mobile phase: methanol:0.04 mol/L ammonium acetate:acetonitrile:triethylamine (pH 7.1, 2:2:1:0.04), flow rate 1.2 mL/min. UV detection ($\lambda = 210$ nm). Retention time: verapamil 4.9 min, norverapamil 3.6 min. Limit of detection, 5 $\mu\text{g/L}$ [Garcia *et al.* 1997].

Plasma GC Column: SE-54 fused silica capillary cross-linked with 5% phenyl methyl silicone (25 m \times 0.2 mm i.d., 0.3 μm). Temperature programme: 100° to 310° at 20°/min for 10 min. Carrier gas: He, 0.9 mL/min. Reference compound: zipeprol. NPD. Retention time: 17.53 min. Limit of detection, 2 $\mu\text{g/L}$ [Shin *et al.* 1996].

HPLC Fluorescence detection ($\lambda_{\text{ex}} = 280$ nm, $\lambda_{\text{em}} = 315$ nm). Limit of detection, 10 $\mu\text{g/L}$ [Ho *et al.* 2000]. Column: Macherey-Nagel cyanopropyl silica (11 \times 4 mm i.d., 30 μm) or ODS (10 \times 4 mm i.d., 10 μm). Mobile phase: acetonitrile:2-aminoheptane:0.01 mol/L sodium acetate buffer (pH 3.0, 25:0.5:75), flow rate 0.9 mL/min. Fluorometric detection ($\lambda_{\text{ex}} = 275$ nm, $\lambda_{\text{em}} = 310$ nm). Limit of quantification, 4.3 $\mu\text{g/L}$, limit of detection, 1.3 $\mu\text{g/L}$ [Ceccato *et al.* 1996]. Column: Chiral-AGP (150 \times 4 mm). Mobile phase: 0.01 mol/L phosphate buffer (pH 6.65):acetonitrile (91:9), flow rate 0.9 mL/min. Fluorescence detection ($\lambda_{\text{ex}} = 227$ nm; $\lambda_{\text{em}} = 308$ nm). Resolution: 3.3. Limit of quantification, 3 $\mu\text{g/L}$ [Stagni, Gillespie 1995].

Serum HPLC Column: α_1 -acid glycoprotein (100 \times 4.0 mm i.d.). Mobile phase: 0.01 mol/L disodium hydrogen phosphate (pH 7.0):acetonitrile (90:10), flow rate 0.9 mL/min. Fluorescence detection ($\lambda_{\text{ex}} = 276$ nm, $\lambda_{\text{em}} = 310$ nm). Limit of quantification, 3 $\mu\text{g/L}$ [Brandsteterova, Wainer 1999].

Urine HPLC See Plasma [Ho *et al.* 2000]. Column: Chiralcel OD-R CSP (250 \times 4.6 mm i.d., 10 μm). Mobile phase: acetonitrile:0.2 mol/L sodium perchlorate (40:60), flow rate 0.8 mL/min. Fluorescence detection ($\lambda_{\text{ex}} = 230$ nm, $\lambda_{\text{em}} = 312$ nm). Limit of quantification, 3 $\mu\text{g/L}$ [Asafu-Adjaye, Shiu 1998].

Disposition in the Body Verapamil is almost completely absorbed after oral administration but undergoes extensive first-pass metabolism. The main metabolic reactions are *N*-dealkylation (*N*-demethylation gives norverapamil, which is

thought to be active) and *O*-demethylation of the resulting compounds. Approximately 70% of a dose is excreted in the urine in 5 days, with ~50% in the first 24 h; <5% is excreted as unchanged drug. The urinary metabolites consist mainly of *N*-dealkylated compounds together with ~10% of the dose as norverapamil or its *O*-demethylated derivative; conjugated *O*-demethylated products account for ~17% of the urinary material. Approximately 16% of a dose is eliminated in the faeces.

Therapeutic Concentration

Following single oral doses of 80 mg to 20 subjects, mean peak plasma concentrations of 38 $\mu\text{g/L}$ verapamil and 26 $\mu\text{g/L}$ norverapamil were attained in ~3 h; after oral doses of 120 mg to the same subjects, mean peak plasma concentrations of 68 $\mu\text{g/L}$ verapamil and 59 $\mu\text{g/L}$ norverapamil were reported at 2 h [McAllister, Kirsten 1982].

Twelve healthy subjects, aged 20–38 years, were administered with a single dose of verapamil 20 mg either as a buccal formulation or orally as a tablet, with a 7-day gap between doses. A mean peak verapamil plasma concentration of 51.28 $\mu\text{g/L}$ was attained at 1.5 h after buccal administration and 31.67 $\mu\text{g/L}$ at 1 h after oral administration. The equivalent concentrations of norverapamil were 5.03 $\mu\text{g/L}$ at 6 h after buccal administration and 27.35 $\mu\text{g/L}$ at 1 h after oral administration [Sawicki, Janicki 2002].

Healthy subjects, 30 young and 30 elderly (~half of each age group were males and half were females), were administered with verapamil 180 mg via a controlled-release gastrointestinal therapeutic system. Mean steady-state plasma concentrations were reported as follows: (*R*)-verapamil, 155.0 $\mu\text{g/L}$ in elderly and 108.6 $\mu\text{g/L}$ in young subjects (in 10.0 h); (*S*)-verapamil, 40.9 $\mu\text{g/L}$ in elderly and 24.2 $\mu\text{g/L}$ in young subjects (in 10.2 and 10.0 h, respectively); (*R*)-norverapamil, 150.3 $\mu\text{g/L}$ in elderly and 121.3 $\mu\text{g/L}$ in young patients (in 11.2 and 10.9 h, respectively); (*S*)-norverapamil, 56.9 $\mu\text{g/L}$ in elderly and 43.2 $\mu\text{g/L}$ in young patients (in 11.0 h) [Gupta *et al.* 1995].

Twelve healthy men (aged 19–37 years) received a single 240-mg oral dose of racemic verapamil as either an immediate-release formulation (in the fasting state) or as a sustained-release formulation. A peak plasma verapamil concentration of 327 $\mu\text{g/L}$ was attained at 1.71 h with the immediate-release preparation and 73 $\mu\text{g/L}$ at 10.8 h after the sustained-release preparation. Measurement of the total (*R*)-verapamil and (*S*)-verapamil levels in the plasma revealed the *R/S* ratio (at C_{max} and at several other times) to be lower with the immediate-release preparation for both verapamil (4.52 versus 5.83%) and norverapamil (2.48 versus 3.04%) [Karim, Piergies 1995].

Nine healthy, male volunteers (mean age 26 years; range, 19–40) were administered 120 mg verapamil twice daily for 3 days before the actual study day. Grapefruit juice or orange juice (control), 200 mL, was also taken twice daily for 5 days beforehand. On the study day, a single oral dose of 120 mg verapamil was administered with either orange or grapefruit juice, after an overnight fast. The steady-state maximum plasma concentration of (*S*)-verapamil was 41 $\mu\text{g/L}$ for the dose taken with grapefruit juice compared with 26 $\mu\text{g/L}$ for the dose taken with orange juice. For (*R*)-verapamil, the maximum concentration was 132 $\mu\text{g/L}$ with grapefruit juice and 94 $\mu\text{g/L}$ with orange juice. These concentrations were observed at 4.6 and 3.9 h, respectively, for (*S*)-verapamil, and 4.3 and 4.0 h, respectively, for (*R*)-verapamil. The peak (*S*)-norverapamil concentrations were 33 and 29 $\mu\text{g/L}$ at 5.8 and 5.1 h for grapefruit and orange, respectively. For (*R*)-norverapamil, these concentrations were 84 and 75 $\mu\text{g/L}$ at 5.2 and 4.0 h, respectively [Ho *et al.* 2000].

Toxicity

In a fatality caused by verapamil ingestion, the following postmortem tissue concentrations were reported: blood 8.8 mg/L, kidney 28 $\mu\text{g/g}$ and liver 165 $\mu\text{g/g}$ [Thomson, Pannell 1981].

Serum concentrations of 3 mg/L verapamil and 2.5 mg/L norverapamil were reported in a 17-year-old girl 12 h after ingestion of an unknown overdose of verapamil; death occurred after 19 h [Orr *et al.* 1982].

A 30-year-old woman being treated with verapamil for supraventricular tachycardia, ingested the equivalent of 2.4 g verapamil with an unknown quantity of alcohol. On admission to hospital, she was unconscious; her blood pressure could not be recorded and she was hypotensive and bradycardic. Toxicological analysis showed that her blood verapamil concentration was 5.18 mg/L. She deteriorated rapidly but was stabilised with plasmapheresis (this reduced the verapamil blood concentration by ~40%). After 4 h of treatment, she developed acute lung, liver and renal failure. She died 38 h after admission to hospital owing to multi-organ failure [Kuhlmann *et al.* 2000].

A 45-year-old woman overdosed on 4 g ordinary-release verapamil tablets. At 1–2 h after ingestion, she was admitted to hospital unconscious, hypotensive and with a low heart beat. The maximum plasma verapamil concentration observed was 2.7 mg/L 2–3 h after the overdose. This concentration was 10- to 20-fold higher than the expected therapeutic range [Kivistö *et al.* 1999].

A 22-year-old male ingested 3.2 mg verapamil with an unknown quantity of alcohol. He was admitted to hospital 2 h after the overdose with complete heart block and a low blood pressure. The maximum plasma concentration detected was 2.2 mg/L 2–3 h after ingestion. As in the case above, this concentration was 10- to 20-fold higher than the expected therapeutic range [Kivistö *et al.* 1999].

A man was found dead in his home with an empty container of verapamil and a partly emptied bottle of vodka in the room. Verapamil was found in his blood at a concentration of 402 mg/L, in his stomach at 49.3 µg/g and in his liver at 42.1 µg/g. His blood alcohol concentration was 1100 mg/L [Janowska, Chudzikiewicz 1996].

Bioavailability ≈20%.

Half-life Plasma half-life verapamil ~2–7 h, it is increased during long-term oral dosing and in subjects with liver disease; norverapamil ~5–13 h.

Volume of Distribution ≈2–6 L/kg.

Clearance Plasma clearance, ~10–20 mL/min/kg.

Distribution in Blood Plasma: whole blood ratio, ~1.2.

Protein Binding ≈90%.

Note For a general review of verapamil, see McTavish, Sorkin [1989].

Dose 120 to 480 mg of verapamil hydrochloride daily.

Veratrine

Counterirritant (Topical)

C₃₂H₄₉NO₉ = 591.7

CAS—8051-02-3 (mixture)

Chemical Properties A mixture of alkaloids from sabadilla, the dried ripe seeds of *Schoenocaulon officinale* (Liliaceae). A white or greyish-white powder. Mp 145° to 155°. Soluble 1 in 1800 of water; soluble 1 in 2.8 of ethanol, 1 in 0.7 of chloroform, 1 in 4.2 of ether and 1 in 80 of olive oil; freely soluble in benzene and amyl alcohol; slightly soluble in glycerol. Log P (octanol/water), 4.0.

Note Veratrine should be distinguished from protoveratrine obtained from veratrum.

Caution Veratrine has a violent irritant action on mucous membranes, even in minute doses, and must be handled with great care.

Colour Tests Liebermann's reagent—brown; Mandelin's test—yellow→orange→violet-brown; Marquis test—orange; sulfuric acid—yellow→violet.

Thin-layer Chromatography System TA—R_f 0.59; system TB—R_f 0.04; system TC—R_f 0.35; system TE—R_f 0.71; system TL—R_f 0.17; system TAE—R_f 0.17.

High Performance Liquid Chromatography System HAA—retention time 13.6 min.

Ultraviolet Spectrum Aqueous acid—262 (A₁—67b), 292 nm.

Infrared Spectrum Principal peaks at wavenumbers 1270, 1085, 1111, 1136, 1234, 1035 cm⁻¹ (KBr disk).

Vetrabutine

Uterine Relaxant (Veterinary)

C₂₀H₂₇NO₂ = 313.4

CAS—3735-45-3

IUPAC Name 1-(3,4-Dimethoxyphenyl)-N,N-dimethyl-4-phenylbutan-1-amine

Synonyms 3,4-Dimethoxy-N,N-dimethyl-α-(3-phenylpropyl)-benzylamine; 1-(3,4-dimethoxyphenyl)-1-dimethylamino-4-phenylbutane; α-(3,4-dimethoxyphenyl)-

N,N-dimethylbenzenebutanamine; N,N-dimethyl-α-(3-phenylpropyl)veratrylamine; dimophebimine.

Chemical Properties A white crystalline powder. Mp 137° to 148°. Bp 166° to 168° at 0.1 mmHg. Soluble 1 in 3 water, of ethanol, and of methanol; slightly soluble in ether, benzene and acetone. Vetrabutine is extracted by chloroform from aqueous alkaline solutions.

Vetrabutine Hydrochloride

C₂₀H₂₇NO₂·HCl = 349.9

CAS—5974-09-4

IUPAC Name 1-(3,4-Dimethoxyphenyl)-N,N-dimethyl-4-phenylbutan-1-amine hydrochloride

Synonym Sp 281

Proprietary Names Monzal; Monzaldon.

Chemical Properties Solid. Mp 146° to 148°.

Colour Tests Ammonium molybdate test—grey-blue (limit of detection, 1.0 µg); ammonium vanadate test—green (limit of detection, 0.1 µg); sulfuric acid-formaldehyde test—dull red→red-brown (limit of detection, 0.1 µg).

Thin-layer Chromatography System T1—R_f 0.47 (location reagent acidified iodoplatinate spray, strong reaction).

Gas Chromatography System G2/225—retention time 0.79 (relative to codeine); system G4/225—retention time 5.30 (relative to diphenhydramine), retention time 0.70 (relative to codeine).

Ultraviolet Spectrum 0.001 N hydrochloric acid—278 nm (E1%, 1 cm 83).

Infrared Spectrum Principal peaks at wavenumbers 462, 1515 cm⁻¹ (KBr disk, hydrochloride).

Disposition in the Body

Metabolism After the IM administration of 50 mg/kg of ¹⁴C-labelled vetrabutine to rats, 20 to 32% was excreted in the urine within 24 h. Approximately half of the radioactivity was excreted in the faeces in the same period.

Toxicity LD₅₀ in rats 500 mg/kg (oral).

Dose Cattle up to 1.5 g, pigs up to 400 mg, sheep up to 250 mg and dogs up to 100 mg, IM.

Vigabatrin

Antiepileptic

C₆H₁₁NO₂ = 129.2

CAS—60643-86-9

IUPAC Name 4-Amino-5-hexenoic acid

Synonym Gamma-vinyl-GABA; γ-vinyl-GABA; GVG; MDL-71754; RMI-71754.

Proprietary Names Sabril; Sabrilax.

Chemical Properties A white to almost white powder. Mp 209°. It is very soluble in water. pK_{a1} 4.02, pK_{a2} 9.72. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

Gas Chromatography System GB—not eluted; system GAJ—not eluted.

Mass Spectrum Principal ions at m/z 56, 84, 111, 69, 82, 54, 67, 45.

Quantification

Plasma GC Column: Chirasil-Val non-packed (20 m × 0.53 mm i.d., 0.125 µm). Carrier gas: He, 2.0 mL/min. Temperature programme: 80° for 1 min to 129° at 20°/min for 2 min to 135° at 1°/min for 20 min to 200° at 20°/min for 10 min. TSD. Limit of detection, 1 mg/L for (R)-(-)-vigabatrin and 0.5 mg/L (S)-(+)-vigabatrin [Schramm *et al.* 1993]. Column: Chirasil-1Val (25 m × 0.2 mm i.d.). SIM acquisition mode. Limit of detection, 5 mg/L [Rey *et al.* 1990].

GC-MS Column: Chirasil-Val (25 m × 0.92 mm o.d.). Temperature programme: 90° for 1 min to 130° at 4°/min. EI ionisation at 70 eV. Limit of detection, 2.5 nmol [Haegele *et al.* 1983].

HPLC Column: Synergy Hydro-RP (150 × 4.6 mm i.d., 4 μm). Mobile phase: 50 mmol/L phosphate buffer: acetonitrile (55:45). Fluorescence detection (λ_{ex} = 300 nm, λ_{em} = 500 nm). Limit of detection, 0.1 mg/L [Mercolini *et al.* 2010]. Column: Chiralcel-ODR (250 × 4.6 mm i.d., 10 μm). Mobile phase: 0.05 mmol/L potassium hexafluorophosphate (pH 4.5): acetonitrile: ethanol (50:40:10), flow rate 0.9 mL/min. UV detection (λ = 340 nm). Limit of detection, 0.5 mg/L for both enantiomers [Franco *et al.* 2007]. Column: Shim-Pack CLS-ODS C₁₈ (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: 10 mmol/L orthophosphoric acid (pH 2.5, 20:80 for 2 min, to 25:75 for 9 min, to 98:2 for 9 min), flow rate 1 mL/min. UV detection (λ = 448 nm). Limit of detection, 0.5 mg/L [Cetin, Atmaca 2004]. Column: Microsorb C₁₈ (150 × 4.6 mm i.d., 5 μm). Mobile phase: 10 mmol/L orthophosphoric acid: acetonitrile: methanol (6:3:1), flow rate 2.0 mL/min. Fluorescence detection (λ_{ex} = 370 nm, λ_{em} = 418 nm). Retention time: 5.6 min. Limit of quantification, 0.08 mg/L, limit of detection, 0.54 mg/L [Tsanacis *et al.* 1991]. Column: Zorbax C₈ (250 × 4.6 mm i.d., 6 μm). Mobile phase: acetonitrile: dioxane: 0.5 mol/L orthophosphoric acid (35:15:50), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 345 nm, λ_{em} = 418 nm). Limit of detection, 0.5 mg/L [Smithers *et al.* 1985].

Serum GC-MS VF-5 MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 40° to 300° at 30°/min. EI ionisation, SIM acquisition mode. Limit of quantification, 2 mg/L [Borrey *et al.* 2005].

HPLC Column: XDB-C₈ (150 × 4.6 mm i.d., 5 μm). Mobile phase: 50 mmol/L acetate buffer: methanol (60:40), flow rate 1.2 mL/min. Fluorescence detection (λ_{ex} = 230 nm, λ_{em} = 350 nm). Limit of detection, 2.5 nmol/L [Hsieh *et al.* 2008]. Column: RP Spherisorb 3ODS2 (150 × 4.6 mm i.d.). Mobile phase: acetonitrile: 55 mmol/L sodium acetate (pH 7.6, 5:95 to 17.5:82.5 in 20 min, to 35:65 in 1 min for 3 min to 5:95 in 1 min for 2 min), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 450 nm). Limit of detection, 0.20 mg/L (R)-(-)-vigabatrin and 0.14 mg/L (S)-(+)-vigabatrin [Vermeij, Edelbroek 1998]. Column: Alltima 3C₁₈ (150 × 4.6 mm i.d.). Mobile phase: methanol: acetonitrile: 20 mmol/L phosphate buffer (pH 7.0), flow rate 0.8 mL/min. Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 450 nm). Limit of quantification, 0.06 mg/L [Vermeij, Edelbroek 1994].

Urine GC-MS See Plasma [Rey *et al.* 1990].

HPLC See Plasma. Limit of detection, 10 mg/L [Smithers *et al.* 1985]. See Plasma [Cetin, Atmaca 2004].

Disposition in the Body Vigabatrin is rapidly and completely absorbed after oral administration and food does not alter the extent of absorption. The inactive (R)-(-)-enantiomer is reported to be present at much higher plasma concentrations than the active (S)-(+)-enantiomer. It is widely distributed and readily crosses the blood-brain barrier. Concentrations in CSF are ~10–15% of those in plasma. Most of a dose is excreted in urine as the unchanged drug as little or no metabolism occurs: 50% is excreted as the (S)-(+)-enantiomer and 45% as (R)-(-)-enantiomer. There does not appear to be any correlation between plasma concentrations and efficacy or toxicity. Haemodialysis reduces plasma concentrations by ~40–60%.

Therapeutic Concentration Plasma concentrations show considerable inter-patient variation.

Eight healthy, male subjects aged between 18 and 40 years, were fasted overnight and administered 1 g vigabatrin orally on an empty stomach or 1 h after breakfast. The individuals were fasted for a further 4 h after dosing. Mean peak plasma concentrations were 30.5 mg/L and 25.3 mg/L for the fasted and fed individuals, respectively, attained at 1.1 and 1.6 h, respectively [Frisk-Holmberg *et al.* 1989].

Twelve individuals (one group of six with a mean age of 12.1 months (infants) and the other group of six with a mean age of 8.7 years (children)) suffering from refractory epilepsy were administered a single oral dose of 50 mg/kg (not exceeding 1.5 g in the older children). At 24 h after the single treatment, multiple dosing at 50 mg/kg twice daily was continued. The mean peak concentration after the single dose was 13.8 mg/L (S)-(+)-vigabatrin and 20.6 mg/L (R)-(-)-vigabatrin, attained at 2.85 and 2.35 h, respectively, for those in the infant group. The peak concentrations for the children group were 19.4 and 34.7 mg/L for the (S)-(+)- and (R)-(-)-enantiomers, respectively, observed at 1.36 and 1.28 h, respectively. The mean concentrations for the multiple dosing were 13.6 mg/L (range, 1.2 to 29.2) and 20.7 mg/L (range, 0.6 to 37.5) for the (S)-(+)- and (R)-(-)-enantiomers, respectively, 1 h after dosing for the infant group. In the group of children, these concentrations were 11.8 mg/L (range, 5.0–24.0) and 21.0 mg/L (range, 3.5–55.1) for the 2 enantiomers, respectively [Rey *et al.* 1990].

Half-life Plasma half-life, 5–8 h

Bioavailability 60–80%.

Volume of Distribution 0.8 L/kg.

Clearance Plasma clearance, 1.7 mL/min/kg.

Protein Binding Not bound.

Dose Vigabatrin 3 g daily; increased in increments of 0.5 to 1 g daily up to a maximum of 4 mg daily or 50 mg/kg.

Note For a review of vigabatrin, see Grant, Heel [1991]; for reviews of the pharmacokinetics of vigabatrin, see Bialer [1993], Elwes, Binnie [1996] and Rey *et al.* [1990].

Viloxazine

Antidepressant

C₁₃H₁₉NO₃ = 237.3

CAS—46817-91-8

IUPAC Name 2-[(2-Ethoxyphenoxy)methyl]morpholine

Chemical Properties pK_a 8.1. Log P (octanol/water), 1.8. Extraction yield (chlorobutane), 0.85 [Demme *et al.* 2005]. Stable in plasma for at least a month at -20° and overnight when stored at -4° [Norman *et al.* 1979].

Viloxazine Hydrochloride

C₁₃H₁₉NO₃·HCl = 273.8

CAS—35604-67-2

Proprietary Names *Vicilan*; *Vivalan*; *Vivarint*.

Chemical Properties Mp 185° to 186°.

Colour Tests Liebermann's reagent—black; Mandelin's test—blue-green; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.42; system TB—R_f 0.06; system TC—R_f 0.23; system TE—R_f 0.36; system TL—R_f 0.06; system TAE—R_f 0.25.

Gas Chromatography System GA—viloxazine RI 1855, M (-AC) RI 2220, M (OH-)(-AC₂) RI 2590, M (O-desethyl-) RI 2360, M (di-oxo-) RI 2325; system GB—viloxazine RI 1923.

High Performance Liquid Chromatography System HF—k 2.70; system HX—RI 325; system HY—RI 273; system HAA—RT 11.0 min

Ultraviolet Spectrum Aqueous acid—273 nm (A₁ = 92b) No alkaline shift

Infrared Spectrum Principal peaks at wavenumbers 1217, 1121, 1252, 739, 1511, 1031 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 56, 100, 138, 110, 57, 237, 70, 41.

Quantification

Blood GC Column: cross-linked fused silica ($25\text{ m} \times 0.2\text{ mm i.d.}$, $0.11\text{ }\mu\text{m}$). Carrier gas: He, 195 kPa. Temperature programme: 180° for 1 min to 300° at $10^\circ/\text{min}$ for 3 min. NPD. Limit of quantification, $76\text{ }\mu\text{g/L}$, limit of detection, $23\text{ }\mu\text{g/L}$ [Martinez *et al.* 2002].

LC-MS Column: Xterra RP₁₈ ($100 \times 2.1\text{ mm i.d.}$). Mobile phase: acetonitrile : 4 mmol/L ammonium formate buffer (pH 3.2, 5 : 95 for 2 min to 20 80 over 2 min to 30 70 over 12 min for 2 min), flow rate 0.3 mL/min . ESI, positive ion mode, MRM acquisition mode. Retention time: 5.3 min. Limit of quantification, $2\text{ }\mu\text{g/L}$ [Titier *et al.* 2007].

Plasma GC Column: GP 3% SP2250 on 80/100 Supelcoport ($1.8 \times 0.4\text{ cm i.d.}$). Carrier gas: N_2 , 20 mL/min . Temperature: 225° . NPD. Retention time: 2.6 min. Limit of detection, $10\text{ }\mu\text{g/L}$ [Altamura *et al.* 1983]. Column: GP 3% SP2250 on 80/100 Supelcoport ($1.8 \times 0.4\text{ cm i.d.}$). Carrier gas: N_2 , 20 mL/min . Temperature: 225° . NPD. Retention time: 2.6 min. Limit of detection, $10\text{ }\mu\text{g/L}$ [Altamura *et al.* 1983]. Column: 3% OV-17 80/100 mesh GasChrom Q ($1.8 \times 4\text{ mm i.d.}$). Carrier gas: N_2 , 20 mL/min . Temperature: 260° . FID. Limit of detection, $200\text{ }\mu\text{g/L}$ [Norman *et al.* 1979].

GC-MS Column: J, W-5 MS ($30\text{ m} \times 0.25\text{ mm i.d.}$, $0.25\text{ }\mu\text{m}$). Carrier gas: He, 1.3 mL/min . Temperature programme: 90° for 1 min to 180° at $50^\circ/\text{min}$ for 10 min to 300° at $10^\circ/\text{min}$ for 2.5 min. EI ionisation at 70 eV, MSD, SIM acquisition mode. Limit of quantification, $4\text{ }\mu\text{g/L}$ [Wille *et al.* 2007]. Column: Varian factor FOUR VF-5ms ($30\text{ m} \times 0.25\text{ mm i.d.}$, $0.25\text{ }\mu\text{m}$). Carrier gas: He, 1.3 mL/min . Temperature programme: 90° for 0.5 min to 180° at $50^\circ/\text{min}$ for 10 min to 300° at $10^\circ/\text{min}$ for 10 min. EI ionisation at 70 eV, MSD, SIM acquisition mode. Limit of detection not reported [Wille *et al.* 2005].

HPLC Column: Hypurity C₁₈ ($250 \times 4.6\text{ mm i.d.}$, $5\text{ }\mu\text{m}$). Mobile phase: acetonitrile : phosphate buffer (pH 3.8, 25 : 75 to 40 : 60 over 10 min to 44 : 56 in 8 min), flow rate 1.0 mL/min . DAD ($\lambda=240\text{ nm}$). Retention time: 6.0 min. Limit of quantification, $25\text{ }\mu\text{g/L}$, limit of detection, $3\text{ }\mu\text{g/L}$ [Duverneuil *et al.* 2003]. Column: Chrompack C₁₈ (15 cm , $5\text{ }\mu\text{m}$). Mobile phase: acetonitrile : sodium hydrogen phosphate (25 : 75, pH 2.5), flow rate 0.9 mL/min . UV detection ($\lambda=220\text{ nm}$). Limit of detection not reported [Kergueris *et al.* 1989]. Mobile phase: acetonitrile : 6 mmol/L TEA : 0.2 mol/L phosphate buffer (pH 3.2), flow rate 1.3 mL/min . Fluorescence detection. Retention time: 8.2 min. Limit of detection, $25\text{ }\mu\text{g/L}$ [Gillilan, Mason 1981].

Serum GC Column: GP-3% SP-2250 on 80/100 mesh Supelcoport ($2.0\text{ m} \times 3\text{ mm i.d.}$). Carrier gas: N_2 , 40 mL/min . Temperature: 245° . NPD. Retention time: ~ 6 min. Limit of detection, $100\text{ }\mu\text{g/L}$ [Fazio *et al.* 1984].

GC-MS Column: PTE5 capillary ($30\text{ m} \times 0.32\text{ mm i.d.}$, $0.25\text{ }\mu\text{m}$). EI ionisation at 70 eV, full scan mode. Limit of detection, $500\text{ }\mu\text{g/L}$ [Lacassie *et al.* 1999].

LC-MS Column: C₁₈ ($50 \times 4.6\text{ mm i.d.}$, $5\text{ }\mu\text{m}$). Mobile phase: methanol : 5 mmol/L acetic acid (pH 3.9, 20 : 80 to 70 : 30 over 4 min for 1 min), flow rate 1.0 mL/min . ESI, positive ion mode, MRM acquisition mode. Limit of quantification, $0.31\text{ }\mu\text{g/L}$ [Kirchherr, Kühn-Velten 2006].

Urine HPLC See Plasma. Limit of detection, $1\text{ }\mu\text{g/L}$ [Gillilan, Mason 1981].

Disposition in the Body Viloxazine is rapidly and completely absorbed after oral administration and crosses the blood–brain barrier. It is extensively metabolised by hydroxylation. Approximately 90% of an oral dose is excreted in the urine in 24 h, of which 12–15% is unchanged drug, 3% is the free 4- and 5-hydroxy metabolites, and more than 40% is the glucuronide conjugate of 5-hydroxyviloxazine; $\sim 16\%$ is excreted as the glucuronide of a hydroxylated 5-oxo metabolite [Case, Reeves 1975].

Therapeutic Concentration

Following single oral doses of 100 mg to 10 subjects, peak plasma concentrations of 1.11–2.93 mg/L (mean 1.7 mg/L) were attained in $\sim 1.5\text{ h}$ [Vandel *et al.* 1982a].

Following oral doses of 400 mg daily in divided doses to 13 subjects, a mean steady-state blood concentration of $\sim 1.3\text{ mg/L}$ was reported [Bayliss, Case 1975].

In 11 subjects receiving 300 mg viloxazine, peak blood concentrations of 3.599 mg/L were achieved in 86 min; when the same dose was given as a sustained-release preparation, peak concentrations of 1.917 mg/L were achieved in 215 min. At 12 h after administration, plasma levels were 0.54–1.6 mg/L and 0.66–2.12 mg/L with the conventional and sustained-release dosage forms, respectively [Kergueris *et al.* 1989].

Toxicity A number of attempted suicides have been reported but recovery has occurred after the ingestion of up to 6.5 g viloxazine together with other drugs.

The following postmortem tissue concentrations were reported in a fatality attributed to viloxazine: blood 45 mg/L, liver 185 $\mu\text{g/g}$ and urine 640 mg/L; death occurred $\sim 8\text{--}12\text{ h}$ after ingestion [Bailey 1976].

Note For cases of overdose with viloxazine, see Brosnan *et al.* [1976].

Half-life Plasma half-life, 2 to 5 h.

Volume of Distribution $\sim 0.5\text{--}1.5\text{ L/kg}$ [Vandel *et al.* 1982b].

Protein Binding $\sim 85\text{--}90\%$.

Note For a review of viloxazine, see Pinder *et al.* [1977].

Dose The equivalent of 100 to 400 mg viloxazine daily.

Vinbarbital

Sedative, Barbiturate

$\text{C}_{11}\text{H}_{16}\text{N}_2\text{O}_3 = 224.3$

CAS—125-42-8

IUPAC Name 5-Ethyl-5-[(E)-pent-2-en-2-yl]-1,3-diazinane-2,4,6-trione

Synonyms Butenamal; 5-ethyl-5-(1-methyl-1-butenyl)-2,4,6-(1H,3H,5H)-pyrimidinetrione; vinbarbitone.

Chemical Properties A white powder. Mp 160° to 163°. Very slightly soluble in water; soluble in ethanol; sparingly soluble in ether. pK_a 7.5 (20°).

Colour Tests Koppanyi–Zwikker test—violet; mercurous nitrate—black; vanillin reagent—violet-brown/colourless.

Thin-layer Chromatography System TD— R_f 0.50; system TE— R_f 0.34; system TF— R_f 0.65; system TH— R_f 0.56; system TAD— R_f 0.57; system TAE— R_f 0.89; system TAJ— R_f 0.56; system TAK— R_f 0.62; system TAL— R_f 0.91 (mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown; Zwikker's reagent, pink).

Gas Chromatography System GA—vinbarbital RI 1753, vinbarbital-Me₂ RI 1670, M (5-(1-ethylpropyl)-5-hydroxybarbituric acid) RI 1790, M (5-(1-ethylpropyl)barbituric acid) RI 1660, M (5-(3-hydroxy-1-methylbutyl)-5-vinylbarbituric acid) RI 1930, M (OH⁻) RI 2070, M (OH⁻)-H₂O RI 2020; system GF—RI 2495.

High Performance Liquid Chromatography System HG— k 4.83; system HH— k 2.32; system HX—RI 379; system HY—RI 363.

Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—238 nm ($A_1^1=452a$); M sodium hydroxide (pH 13)—254 nm ($A_1^1=374b$).

Infrared Spectrum Principal peaks at wavenumbers 1675, 1760, 1725, 1234, 1282, 1298 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 195, 41, 141, 69, 39, 152, 135, 196.

Quantification See under Amobarbital.

Dose 100 to 200 mg daily.

Vinblastine

Antineoplastic

$C_{46}H_{58}N_4O_9 = 811.0$

CAS—865-21-4

Synonyms Vinblastini; vincalcoblastine; vincalcoblastine; VLB.

Chemical Properties An alkaloid extracted from periwinkle, *Vinca rosea* (*Catharanthus roseus*) (Apocynaceae). Crystals. Mp 211° to 216°. Practically insoluble in water; soluble in ethanol, acetone and chloroform. pK_a 5.4, 7.4. Log P (octanol/water), 3.7.

Vinblastine Sulfate

$C_{46}H_{58}N_4O_9 \cdot H_2SO_4 = 909.1$

CAS—143-67-9

Proprietary Names Blastovin; Cellblastin; Lemblastin; Solblastin; Velban; Velbe.

Chemical Properties A white to slightly yellow, very hygroscopic, amorphous or crystalline powder. Mp 284° to 285°. Soluble 1 in 10 of water and 1 in 50 of chloroform; very slightly soluble in ethanol; practically insoluble in ether.

Colour Test Marquis test—red.

Thin-layer Chromatography System TA— R_f 0.60; system TB— R_f 0.01; system TC— R_f 0.60; system TE— R_f 0.57; system TL—RF 29; system TAE— R_f 0.46.

High Performance Liquid Chromatography System HY—RI 355; system HAA—retention time 8.4 min.

Ultraviolet Spectrum Aqueous acid—268 nm ($A_1^1=176b$).

Infrared Spectrum Principal peaks at wavenumbers 1227, 1136, 1111, 1724, 1176, 1613 cm^{-1} (vinblastine sulfate, KBr disk).

Quantification

Plasma HPLC Fluorescence detection. Vinblastine and metabolites. Limit of detection, 1 $\mu g/L$ for vinblastine [van Tellingen *et al.* 1991]. Electrochemical detection. Limit of detection, 100 pg for vinblastine, desacetylvinblastine, vincristine and vindesine [Vendrig *et al.* 1988]. For a method for the quantification of vinblastine, vincristine and vindesine, see de Smet *et al.* [1985].

Radioimmunoassay Limit of detection, 2.1 $\mu g/L$ for vinblastine, 3.8 $\mu g/L$ for vincristine [Teale *et al.* 1977].

Urine HPLC See Plasma [van Tellingen *et al.* 1991]. See Plasma [Vendrig *et al.* 1988]. For a method of quantification for vinblastine, vincristine and vindesine, see de Smet *et al.* [1985].

Disposition in the Body Poorly absorbed after oral administration. After IV administration, it is metabolised to desacetylvinblastine which is active. About 14% of a radioactively labelled dose is excreted in the urine in 72 h and 10% is eliminated in the faeces in the same period.

Therapeutic Concentration

After a bolus IV dose of 3 mg/m^2 given before or after cisplatin (100 mg/m^2) to 16 subjects, plasma vinblastine concentrations at 10 h were 3.2 to 6.3 $\mu g/L$ (mean, 4.8) and 2.7 to 7.1 $\mu g/L$ (mean, 4.9), respectively. Neutropenia was less severe in patients with plasma vinblastine levels <2.75 $\mu g/L$ at 10 h [Links *et al.* 1999].

Toxicity

A vinblastine overdose in an 18-month-old child, who received 1.5 mg/kg instead of 0.15 mg/kg, was successfully treated with steroids and citrovorum factor [Conter *et al.* 1991].

Half-life Plasma half-life (total radioactivity), about 20 h.

Protein Binding About 99%.

Dose Initially 100 $\mu g/kg$ of vinblastine sulfate weekly, by IV injection.

Conter V *et al.* (1991). Overdose of vinblastine in a child with Langerhans' cell histiocytosis: toxicity and salvage therapy. *Pediatr Hematol Oncol* 8: 165–169.

van Tellingen O *et al.* (1991). High-performance liquid chromatographic determination of vinblastine, 4-O-deacetylvinblastine and the potential metabolite 4-O-deacetylvinblastine-3-oic acid in biological fluids. *J Chromatogr* 553: 47–53.

Vendrig DE *et al.* (1988). Analysis of vinca alkaloids in plasma and urine using high-performance liquid chromatography with electrochemical detection. *J Chromatogr* 424: 83–94.

Vincristine

Antineoplastic

$C_{46}H_{56}N_4O_{10} = 825.0$

CAS—57-22-7

Synonyms Leurocristine; 22-oxovincaleukoblastine.

Chemical Properties An alkaloid obtained from *Vinca rosea* (*Catharanthus roseus*) (Apocynaceae). Crystals. Mp 218° to 220°. pK_a 5.0, 7.4. Log *P* (octanol/water), 2.8.

Vincristine Sulfate

$C_{46}H_{56}N_4O_{10} \cdot H_2SO_4 = 923.0$

CAS—2068-78-2

Proprietary Names *Cellcrstin*; *Citomid RU*; *Farmistin*; *Faulcris*; *Filcrin*; *Oncovin*; *Pericristine*; *Vincasar*; *Vincrin*; *Vincrisul*; *Vintec*.

Chemical Properties A white to slightly yellow, very hygroscopic, amorphous or crystalline powder. Mp about 277°. Soluble 1 in 2 of water and 1 in 30 of chloroform; slightly soluble in ethanol; practically insoluble in ether; soluble in methanol.

High Performance Liquid Chromatography System HAA—retention time 13.8 min.

Ultraviolet Spectrum Aqueous acid—256 ($A_1^1=181b$), 297 nm ($A_1^1=179b$).

Infrared Spectrum Principal peaks at wavenumbers 1230, 1745, 1170, 1685, 1030, 1130 cm^{-1} (vincristine sulfate, KBr disk).

Quantification See also under Vinblastine.

Plasma HPLC Electrochemical detection. For method, see Koopmans *et al.* [2001]. UV detection. Limit of detection, <28 $\mu g/L$ [Embree *et al.* 1997].

Serum HPLC Electrochemical detection. Limit of detection, 0.3 $\mu g/L$ [Bloemhof *et al.* 1991].

Disposition in the Body Poorly absorbed after oral administration. After IV injection it disappears rapidly from the blood and is excreted mainly in the bile. About 12% of a dose is excreted in the urine in 72 h and 70% is eliminated in the faeces in the same period.

Toxicity

A vincristine overdose (7.5 mg/m^2) was accidentally administered to 3 children, 2 of whom survived and 1 of whom died. The children were treated with double-volume exchange transfusions. In the 2 children who survived, the vincristine plasma levels were, respectively: pre-exchange 39.5 and 14.4 $\mu g/L$, post-exchange 16.7 and 4.1 $\mu g/L$, 8th day 2.6 and 2.9 $\mu g/L$; in the child who died the levels were: pre-exchange 26.0 $\mu g/L$, post-exchange 24.0 $\mu g/L$, 8th day 5.6 $\mu g/L$ [Kosmidis *et al.* 1991.]

Half-life Plasma half-life, about 3 h; a terminal elimination half-life of about 23 h has also been reported.

Dose Initially 25 to 75 $\mu g/kg$ of vincristine sulfate weekly, by IV injection.

Bloemhof H *et al.* (1991). Sensitive method for the determination of vincristine in human serum by high-performance liquid chromatography after on-line column-extraction. *J Chromatogr* 572: 171–179.

Vindesine

Antineoplastic

$C_{43}H_{55}N_5O_7 = 753.9$

CAS—53643-48-4

Synonyms 3-(Aminocarbonyl)-*O*⁴-deacetyl-3-de(methoxycarbonyl)-vincalcoloblastine; desacetyl vinblastine amide; VDS.

Chemical Properties Crystals. Mp 230° to 232°. pK_a (DMF 66%) 5.4, 7.4; (water) 6.0, 7.7. Log *P* (octanol/water), 4.4.

Vindesine Sulfate

$C_{43}H_{55}N_5O_7 \cdot H_2SO_4 = 852.0$

CAS—59917-39-4

Proprietary Names *Eldisin(e)*; *Enison*; *Gesidine*.

Chemical Properties An amorphous solid. Freely soluble in water.

Ultraviolet Spectrum Methanol—270 nm ($A_1^1=235b$).

Infrared Spectrum Principal peaks at wavenumbers 1120, 1230, 1680, 1175, 1610, 1038 cm^{-1} (vindesine sulfate, KBr disk).

Quantification See also under Vinblastine.

Plasma Radioimmunoassay Limit of detection, 50 ng/L [Rahmani *et al.* 1983].

Disposition in the Body Poorly absorbed after oral administration. After IV injection, about 13% of a dose is excreted in the urine in 24 h.

Therapeutic Concentration

Fifteen subjects received therapy with vindesine either by IV bolus injection at doses ranging from 0.7 to 1.2 mg/m^2 or by 5 day infusions (total dose 5 mg/m^2) in combination with cisplatin (20 mg/m^2 daily) and bleomycin (6 mg/m^2 daily) for 5 days. Steady state vindesine concentrations of 4 to 15 $\mu g/L$ were reached after about 30 h of infusion administration [Rahmani *et al.* 1985].

Half-life Plasma half-life, about 24 h.

Dose Initially 3 mg/m^2 of vindesine sulfate weekly, by IV injection.

Rahmani R *et al.* (1983). A 125I-radiolabelled probe for vinblastine and vindesine radioimmunoassays: applications to measurements of vindesine plasma levels in man after intravenous injections and long-term infusions. *Clin Chim Acta* 129: 57–69.

Vinorelbine

Antineoplastic

$C_{45}H_{54}N_4O_8 = 779.0$

CAS—71486-22-1

Synonyms nor-5'-Anhydrovinblastine; 3',4'-didehydro-4'-deoxy-*C'*-norvincaleukoblastine; NVBKW-2307.

Proprietary Name *Navelbine*

Chemical Properties pK_a 5.4. $\log P$ (octanol/buffer, pH 7.2), 16.

Vinorelbine Tartrate

$C_{45}H_{54}N_4O_8 \cdot 2C_4H_6O_6 = 1079.1$

CAS—125317-39-7

Synonym Vinorelbine ditartrate

Proprietary Names *Biovelbin*; *Eumades*; *Navelbine*.

Chemical Properties A yellow to white amorphous powder. Soluble in water and in alcohol.

High Performance Liquid Chromatography Column: cyano Spherisorb (250×4.6 mm i.d., $5 \mu\text{m}$). Mobile phase: acetonitrile: 80 mmol/L ammonium acetate (pH 2.5, 50:50), flow rate 1 mL/min. IS: vinoblastine sulfate. Fluorescence detection ($\lambda_{\text{ex}}=280$ nm; $\lambda_{\text{em}}=360$ nm). Retention time: vinorelbine, 5.4 min; IS, 4.5 min [Gauvin *et al.* 2000].

Ultraviolet Spectrum Ethanol—215, 268, 282, 293, 310 nm.

Quantification

Plasma HPLC Column: C_{18} Novapak (300×3.9 mm i.d.). Mobile phase: acetonitrile: phosphate buffer (pH 2.7, 60:40), flow rate 0.9 mL/min. Fluorescence detection ($\lambda_{\text{ex}}=280$ nm; $\lambda_{\text{em}}=360$ nm). Retention time: 13 min. Limit of detection, $2 \mu\text{g/L}$ [Robieux *et al.* 1996]. Fluorescence detection ($\lambda_{\text{ex}}=270$ nm; $\lambda_{\text{em}}=320$ nm). Limit of detection, $1.5 \mu\text{g/L}$ [van Tellingen *et al.* 1992]. Electrochemical detection. Limit of detection, about $1 \mu\text{g/L}$ [Nicot *et al.* 1990].

Serum HPLC UV detection ($\lambda=268$ nm). Limit of detection, $2.5 \mu\text{g/L}$ for vinorelbine and desacetylvinorelbine [Jehl *et al.* 1990].

Urine HPLC See Plasma. Limit of detection, $15 \mu\text{g/L}$ [van Tellingen *et al.* 1992]. UV detection ($\lambda=268$ nm). Limit of detection, $5.0 \mu\text{g/L}$ for vinorelbine and desacetylvinorelbine [Jehl *et al.* 1990].

Disposition in the Body Vinorelbine is rapidly absorbed and peak plasma concentrations increase with dose between 0.9 and 2.0 h after administration. The drug shows triphasic pharmacokinetics after IV administration. It is widely distributed and highly bound to platelets (78%) and lymphocytes. Vinorelbine is metabolised in the liver to desacetylvinorelbine which has antineoplastic activity. It is excreted primarily in faeces via bile, and to a lesser extent it is also excreted in urine as the unchanged drug and as metabolites. Recovery of the drug is incomplete which suggests that it may be retained in tissue.

Therapeutic Concentration

Eight male patients with lung cancer (stage III or IV), aged between 51 and 74 years, were IV administered a weekly dose of 30 mg/m^2 over 15 min. A mean peak plasma concentration of $780 \mu\text{g/L}$ (range, 260 to $1230 \mu\text{g/L}$) was observed [Marquet *et al.* 1992].

Five patients, with a mean age of 56.7 years, with advanced breast cancer were treated with 30 mg/m^2 vinorelbine IV over a 20 min infusion. Mean peak plasma concentrations of $179 \mu\text{g/L}$ were observed at 0.5 h and plasma

concentrations remained above $2 \mu\text{g/L}$ for 48 h or longer after administration [Robieux *et al.* 1996].

Toxicity

In a study carried out in 8 male patients with lung cancer, 2 patients died resulting from haematological toxicity, namely anaemia. Other toxicological effects observed were leucopenia and neurological toxicity [Marquet *et al.* 1992].

Half-life Plasma half-life, 28 to 44 h.

Volume of Distribution 25 to 100 L/kg ; steady-state mean 47.6 L/kg (range, 13.8 to 156).

Clearance Plasma clearance, 16 to 21 mL/min/kg (mean, 1.28 L/h/kg ; range, 0.58 to 2.61).

Distribution in Blood Vinorelbine, 84% bound to red blood cells, mainly platelets.

Protein Binding 14%.

Note For a review of the pharmacokinetics of vinorelbine, see Levêque and Jehl [1996].

Dose Initially the equivalent of 25 to 30 mg per m^2 of vinorelbine IV weekly.

Vinylbital

Hypnotic, Barbiturate

$C_{11}H_{16}N_2O_3 = 224.3$

CAS—2430-49-1

IUPAC Name 5-Ethenyl-5-pentan-2-yl-1,3-diazinane-2,4,6-trione

Synonyms Butyvalin; 5-ethenyl-5-(1-methylbutyl)-2,4,6-(1*H*,3*H*,5*H*)-pyrimidinetrione; vinylbitone; vinylmalum.

Proprietary Names *Optanox*; *Speda*.

Chemical Properties Crystals. Mp 90° to 92° . $\log P$ (octanol/water), 1.9.

Thin-layer Chromatography System TD— R_f 0.38; system TE— R_f 0.39; system TF— R_f 0.64; system TAD— R_f 0.66; system TAE— R_f 0.89.

Gas Chromatography System GA—vinylbital RI 1729, vinylbital-Me₂ RI 1655, M (OH-)-H₂O RI 1995, M (desvinyl-) RI 1665; system GAJ—vinylbital RRT 0.798 (relative to methylphenobarbital).

High Performance Liquid Chromatography System HX—RI 424; system HZ—retention time 4.1 min; system HAA—retention time 16.6 min.

Ultraviolet Spectrum Aqueous alkali—247 nm ($A_1=298b$).

Infrared Spectrum Principal peaks at wavenumbers 1692, 1730, 1750, 1318, 1220, 1630 cm^{-1} .

Quantification See also under Amobarbital.

Plasma GC AFID. Limit of detection, <125 $\mu\text{g/L}$ [Breimer, de Boer 1976].

Disposition in the Body Readily absorbed after oral administration. Metabolites which have been identified in urine are 3'-hydroxyvinylbital and the corresponding desvinyl derivative, 5-(3-hydroxy-1-methylbutyl)barbituric acid. <5% of a dose is excreted in the urine unchanged in 72 h.

Therapeutic Concentration

Following a single oral dose of 150 mg to 6 subjects, peak plasma concentrations of 2.2 to 3.9 mg/L were attained in 1 to 2 h [Breimer, de Boer 1976].

Half-life Plasma half-life, 18 to 34 h (mean, 24).

Volume of Distribution About 0.7 L/kg.

Dose 100 to 200 mg, as a hypnotic.

Breimer DD, de Boer AG (1976). Pharmacokinetics and relative bioavailability of vinylbital in man after oral and rectal administration. *Arzneimittelforschung* 26: 448–454.

Viomycin

Antibiotic, Tuberculostatic

$\text{C}_{25}\text{H}_{43}\text{N}_{13}\text{O}_{10}$ = 685.7

CAS—32988-50-4

IUPAC Name (3*S*)-3,6-Diamino-*N*-[(3*S*,6*Z*,9*S*,12*S*,15*S*)-3-[(4*R*,6*S*)-2-amino-6-hydroxy-3,4,5,6-tetrahydropyrimidin-4-yl]-6-[(carbamoylamino)methylidene]-9,12-bis(hydroxymethyl)-2,5,8,11,14-pentaoxo-1,4,7,10,13-pentazacyclohexadec-15-yl]hexanamide

Synonyms Celiomycin; florimycin.

Chemical Properties An antimicrobial polypeptide base produced by certain strains of *Streptomyces griseus* var. *purpureus*. Log *P* (octanol/water) –11.4 [Meylan, Howard 1995].

Viomycin Sulfate

$\text{C}_{25}\text{H}_{43}\text{N}_{13}\text{O}_{10}, \text{H}_2\text{SO}_4$
CAS—37883-00-4

IUPAC Name (3*S*)-3,6-Diamino-*N*-[(3*S*,6*Z*,9*S*,12*S*,15*S*)-3-[(4*R*,6*S*)-2-amino-6-hydroxy-3,4,5,6-tetrahydropyrimidin-4-yl]-6-[(carbamoylamino)methylidene]-9,12-bis(hydroxymethyl)-2,5,8,11,14-pentaoxo-1,4,7,10,13-pentazacyclohexadec-15-yl]hexanamide sulfuric acid

Synonym Tuberactinomycin B

Proprietary Names *Viocin*; *Vionactane*.

Chemical Properties White hygroscopic powder. Mp 252° (anhydrous) or 280° with decomposition. Very soluble in water, slightly soluble in ethanol, almost insoluble in ether.

Colour Test Ammonium molybdate test—faint blue (limit of detection, 1.0 μg).

Thin-layer Chromatography System T1— R_f 0.00 (location reagent potassium permanganate spray, positive reaction).

Ultraviolet Spectrum Aqueous acid (0.1 N H_2SO_4)—269 nm, neutral—269 nm.

Infrared Spectrum Principal peaks at wavenumber 1700, 1075, 1500, 3250, 1250 cm^{-1} (KBr disk) [Phillips, Ragheb 1965].

Mass Spectrum Principal ions at *m/z* 686, 668, 670, 728, 700 [Pittenauer *et al.* 2006].

Quantification

Note For an ELISA assay for the analysis of viomycin, see Kitagawa *et al.* [1976]. For a review of the chromatographic analysis of antituberculosis drugs, see Holdiness [1985].

Disposition in the Body Viomycin is only partially absorbed if given by mouth, and therapeutic blood levels are difficult to attain by this route of administration. It does not readily pass the normal blood–brain barrier or into peritoneal or pleural effusions. It is mainly excreted by the kidneys with ~85% of a dose being recovered unchanged in the urine within 24 h [Holdiness 1984].

Therapeutic Concentration

Serum concentrations of viomycin have been reported to range from 12 to 40 mg/L 1 h after a dose of 500 mg IM, falling to ~5 mg/L after 8 h.

A dose of 1000 mg given IM resulted in a mean maximum plasma concentration of 25 to 50 $\mu\text{g/mL}$ at 2 h [Pyle 1970].

Practically all strains of *M. tuberculosis* are inhibited by viomycin concentrations in the 1 to 10 $\mu\text{g/mL}$ range [Holdiness 1984].

Toxicity

In large doses (30 to 75 mg/kg) viomycin suppresses serum potassium and calcium concentrations as early as 6 weeks after the initiation of therapy [Adcock *et al.* 1954; Schaffeld *et al.* 1954; Werner *et al.* 1951].

One 58-year-old male who received acceptably low doses (in combination with pyrazinamide) developed profound electrolyte imbalances that eventually resulted in mental confusion and grand mal seizures [Vanasin *et al.* 1972].

The coadministration of viomycin and pyrazinamide resulted in electrolyte imbalances, including hypocalcaemia, hypomagnesaemia, hypokalaemia and hypophosphataemia in a 42-year-old woman [Clarke, McCarthy 1961].

Damage to the eighth cranial nerve with deafness and loss of vestibular function has occurred in humans. The potential for toxicity could be avoided by limiting the daily dose to 1 to 2 g IM in 1 or 2 doses and restricting daily administration to a maximum of 3 weeks [Holdiness 1987].

A study of 75 patients found vestibular function disturbances in 28%, vertigo in 5.3%, dizziness alone in 24% and mild and severe hearing loss in 2.7% of individuals receiving 1 g daily [Garfield *et al.* 1966].

The LD_{50} in mice (IV) is 165 to 240 mg/kg.

Dose Up to 1 mega unit daily, IM.

Adcock JD *et al.* (1954). The use of viomycin in patients with pulmonary tuberculosis. *Am Rev Tuberc* 69: 543–553.

Voglibose

Antidiabetic, α -Glucosidase Inhibitor

$C_{10}H_{21}NO_7 = 267.3$

CAS—83480-29-9

IUPAC Name 5-(1,3-dihydroxypropan-2-ylamino)-1-(hydroxymethyl)cyclohexane-1,2,3,4-tetrol

Synonyms AO-128; 3,4-dideoxy-4-[[2-hydroxy-1-(hydroxymethyl)ethyl]amino]-2-C-(hydroxymethyl)-D-epi-inositol.

Proprietary Name Basen

Chemical Properties Colourless crystals, Mp 162° to 163°

Disposition in the Body Voglibose is slowly and poorly absorbed, and is rapidly excreted. Little metabolism occurs and no metabolites have as yet been identified. Within 48 h of oral administration, it is almost totally excreted in the faeces (93%) as the unchanged drug with a small amount in urine (4%). Maximum concentrations are reached in tissues up to 1 h after oral administration. Penetration of the blood-brain barrier and erythrocyte membrane is low.

Toxicity Voglibose competitively and reversibly inhibits the alpha-glucosidase enzymes; glucoamylase, sucrase, maltase and isomaltase, found in the small intestine, and this delays hydrolysis of complex carbohydrates. It is unlikely to produce hypoglycaemia in overdose, but abdominal discomfort and diarrhoea may occur.

Bioavailability <6%.

Volume of Distribution Low tissue affinity.

Protein Binding <15%.

Dose 200 to 300 μ g orally 3 times a day.

VX

Anticholinesterase, Organophosphate Nerve Agent

$C_{11}H_{26}NO_2PS = 267.4$

CAS—50782-69-9

IUPAC Name Methylphosphonothioic acid S-[2-[bis(1-methylethyl)amino]ethyl] O-ethyl ester

Synonyms O-Ethyl S-[2-(diisopropylamino)ethyl]methylphosphonothioate; Tx 60.

Chemical Properties Odourless liquid. Mp -39°. Bp 300°. Soluble in water. pK_a 8.6 [Epstein *et al.* 1974], 9.4 [van der Schans *et al.* 2003]. Log *P* (octanol/water), 2.09 [Munro *et al.* 1999]. Samples were stable after 8 and 48 h at room temperature and after 3 freeze-thaw cycles [McGuire *et al.* 2008a]. At a pH of \approx 6.0, stock solutions were stable at 4° for 2 weeks [Wils, Hulst 1990].

Gas Chromatography-Mass Spectrometry Column: DB5-MS (25 m \times 0.22 mm i.d., 0.33 μ m). Carrier gas: He, 0.9 mL/min. Temperature programme: 40° for 2 min to 160° at 20°/min to 310° at 30°/min for 5 min. ATD, full scan mode. Limit of detection, 50 ng [Carrick *et al.* 2001].

Liquid Chromatography-Mass Spectrometry Column: Waters Atlantis HILIC (50 \times 2.1 mm i.d., 3 μ m). Mobile phase: acetonitrile:20 mmol/L ammonium acetate (86:14). ESI, negative ion mode, SRM acquisition mode. Limit of detection, ethylmethylphosphonic acid (EMPA) 160 ng/L [Mawhinney *et al.* 2007a]. The effect of post-column addition of organic solvents on this method is reported in [Mawhinney *et al.* 2007b].

Mass Spectrum Principal ions at *m/z* 181, 80, 123, 256, 161, 197, 304, 93 (EMPA-PFB derivative).

Quantification

Blood GC-MS Column: Restek Rtx-5MS (30 m \times 0.25 mm i.d., 0.25 μ m). Carrier gas: He, 1.0 mL/min. Temperature programme: 35° for 2 min to 125° at 15°/min to 325° at 30°/min. CI, MRM acquisition mode. Limit of detection, 4 μ g/L [McGuire *et al.* 2008b].

Plasma GC-MS Column: Phenomenex ZB-5 (60 m \times 0.25 mm i.d., 0.25 μ m). Carrier gas: He, 1.0 mL/min. Temperature programme: 68° for 2.5 min to 175° at 6.7° for 16 min to 310° at 50°/min for 2.5 min. EI ionisation mode. Limit of detection, 5.5 ng/L for G-VX [Solano *et al.* 2008].

LC-MS Column: Chiralcel OD-H (25 cm \times 4.6 mm i.d.). Mobile phase: hexane: isopropyl alcohol (92:08), flow rate: 0.8 mL/min. DAD ($\lambda = 210$ nm) followed by positive ion mode, full scan mode. Limit of detection not reported [Smith 2004].

Serum GC-MS Column: DB-1 megabore (30 m \times 0.53 mm i.d., 1.5 μ m). Carrier gas: He, 6.5 mL/min. Temperature programme: 50° to 270° at 10°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, EMPA 10 μ g/L [Miki *et al.* 1999]. Column: Hewlett Packard Ultra 2 (25 m \times 0.32 mm i.d., 0.52 μ m). Carrier gas: He, 45 cm/s. Temperature programme: 70° for 2 min to 300° at 10°/min. EI ionisation at 70 eV. Limit of detection, EMPA 0.1 mg/L [Tsuchihashi *et al.* 1998].

HPLC Column: Shim-pack IC-A3 (150 \times 4.6 mm i.d., 5 μ m). Mobile phase: 0.5 mmol/L phthalic acid:0.1 mmol/L Tris:5% acetonitrile, flow rate 1 mL/min. UV detection ($\lambda = 266$ nm). Limit of detection, EMPA 40 μ g/L [Katagi *et al.* 1997].

LC-MS Column: CAPCELL PAK UG C_{18} (150 \times 1.5 mm i.d.). Mobile phase: 5 mmol/L ammonium acetate:acetonitrile (55:45, containing 0.1% glycerol), flow rate 100 μ L/min. FAB ionisation. Limit of detection, EMPA 3 μ g/L [Katagi *et al.* 1999].

Urine GC-MS Column: Restek Rtx-5MS capillary (30 m \times 0.25 mm i.d., 0.25 μ m). Carrier gas: He, 40 cm/s. Temperature programme: 60° for 1 min to 180° at 30°/min to 280° at 10°/min for 2 min. CI, negative ion mode, SRM acquisition mode. Limit of detection, EMPA 0.5 μ g/L [Riches *et al.* 2005]. Column: DB-5MS capillary (30 m \times 0.25 mm i.d., 0.25 μ m). Carrier gas: He. Temperature programme: 70° for 1.5 min to 250° in 5 min at 40°/min for 3 min. MRM acquisition mode. Limit of detection, EMPA 0.9 μ g/L [Barr *et al.* 2004]. Column: DB-5 capillary (30 m \times 0.32 mm i.d., 0.25 μ m). Carrier gas: He. Temperature programme: 50° for 1.5 min to 250° at 40°/min in 5 min for 5 min. SRM acquisition mode. Limit of detection, 4 μ g/L [Driskell *et al.* 2002]. Column: DB-1 megabore (30 m \times 0.53 mm i.d., 1.5 μ m). Carrier gas: He, 6.5 mL/min. Temperature programme: 50° to 270° at 10°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, EMPA 5 μ g/L [Miki *et al.* 1999].

Oral Fluid GC-MS Column: DB-1 megabore (30 m \times 0.53 mm i.d., 1.5 μ m). Carrier gas: He, 6.5 mL/min. Temperature programme: 50° to 270° at 10°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, EMPA 20 μ g/L [Miki *et al.* 1999].

Other GC Water. Column: CP-Sil 19 (50 m \times 0.32 mm i.d., 0.4 μ m). Temperature programme: 60° for 3 min to 70° at 5°/min for 7 min to 180° at 10°/min to 240° at 15°/min for 12 min. Limit of detection, ng/L range [Degenhardt-Langelaa, Kientz 1996].

GC-MS Minipig Blood. Column: Restek Rtx-5MS 5% diphenyl 95% dimethyl polysiloxane (30 m \times 0.25 mm i.d.). Carrier gas: He, 1 mL/min. Temperature programme: 35° for 2 min to 100° at 15°/min for 0.1 min to 280° at 35°/min for 1 min. CI, MRM acquisition mode. Limit of quantification, 5 μ g/L [Byers *et al.* 2008]. Minipig Plasma. Column: Restek Rtx-5MS (30 m \times 0.25 mm i.d., 0.25 μ m). Carrier gas: He, 1 mL/min. Temperature programme: 70° for 2 min to 300° at 25°/min for 2 min. Retention times: VX and deuterated VX 9.2 to 9.3 min. Limit of quantification, 10 μ g/L [McGuire *et al.* 2008a].

LC-MS River Water. Column: CAPCELL PAK UG C_{18} (150 \times 1.5 mm i.d.). Mobile phase: 5 mmol/L ammonium acetate:acetonitrile (55:45) containing 0.1% glycerol, flow rate 100 μ L/min. FAB ionisation. Limit of detection, EMPA 1 μ g/L [Katagi *et al.* 1999]. Spiked Soil Samples. Column: LiChrosorb C_{18} (250 \times 5 mm i.d., 7 μ m). Mobile phase: methanol:0.1 mol/L ammonium acetate (80:20) or acetonitrile: methanol:0.25 mol/L ammonium acetate (70:20:10), flow rate 1.2 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of detection, 5 μ g/L [Wils, Hulst 1990].

Note For a review article on the chromatographic analysis of chemical warfare agents, see Witkiewicz *et al.* [1990].

Disposition in the Body At pH <6 and >10, the formation of EMPA and diisopropylethyl mercaptoamine (DESH) predominates. The latter can be oxidised to bis(2-diisopropylaminoethyl) disulfide (EA 4196) or react with the diisopropylethyleneimmonium ion ($(CH_2)_2N^+(C_3H_7)_2$) to form bis(2-diisopropylaminoethyl) sulfide. At neutral and alkaline pH values (7 to 10), this pathway competes with dealkylation of the ethoxy group to yield the environmentally stable EA 2192 and ethanol. Although EMPA can theoretically be slowly hydrolysed to methylphosphonic acid (MPA), it has not been demonstrated in aqueous solutions [Munro *et al.* 1999].

Toxicity

On June 1, 2006 a laboratory worker was accidentally exposed to VX. Red blood cell samples were obtained from the worker at 1, 6, 8, 20 and 27 days following exposure. Levels were determined as follows:

Days post exposure	G-VX concentration (ng/L)
1	219.9 \pm 97.10
6	144.8 \pm 57.80
8	279.1 \pm 170.5
20	128.9 \pm 17.50
27	96.90 \pm 60.40

[McGuire *et al.* 2008b].

- A 28-year-old was attacked by 2 members of a cult. They sprinkled VX on his neck and he collapsed. He was carried to hospital and treated but he died 10 days later. Serum that was collected ≈ 1 h after his exposure to VX and stored at -20° was analysed for its VX content. The concentration of 2-(diisopropylaminoethyl)methyl sulfide in the serum sample was estimated to be 143 $\mu\text{g/L}$ [Tsuchihashi *et al.* 1998].

Warfarin

Anticoagulant, Rodenticide

C₁₉H₁₆O₄ = 308.3

CAS—81-81-2

IUPAC Name 2-Hydroxy-3-(3-oxo-1-phenylbutyl)chromen-4-one

Synonym 4-Hydroxy-3-(3-oxo-1-phenylbutyl)coumarin

Proprietary Names *Biotrol*; *Dethmor*; *Sorex* (all rodenticides).

Chemical Properties Colourless crystals. Mp of the purified compound 159° to 160°; of the technical grade 157°. Freely soluble in alkaline aqueous solutions; soluble in acetone and dioxane; moderately soluble in alcohols; practically insoluble in water, benzene and cyclohexane. pK_a 4.5 [Hou *et al.* 2007], 5.0 (20°). Log P (octanol/pH 8.0), 0.0; (octanol/water), 3.47 [Hou *et al.* 2007], 2.60. Quality control samples were stable for 281 days at -20°, extracted samples were stable in polypropylene plates for at least 7 days when stored at 5°, and stock solutions were stable at 5° for 112 days in polypropylene containers [Coe *et al.* 2006].

Warfarin Potassium

C₁₉H₁₅KO₄ = 346.4

CAS—2610-86-8

Proprietary Name *Athrombin-K*

Chemical Properties A white crystalline powder that discolours on exposure to light. Soluble 1 in 1.5 of water and 1 in 1.9 of ethanol; very slightly soluble in chloroform and ether.

Warfarin Sodium

C₁₉H₁₅NaO₄ = 330.3

CAS—129-06-6

Proprietary Names *Aldocumar*; *Coumadin(e)*; *Jantoven*; *Marevan*; *Panwarfin*; *Sofarin*; *Varfine*; *Waran*; *Warfilone*.

Chemical Properties A white amorphous or crystalline powder which discolours on exposure to light. Soluble 1 in <1 of water and ethanol; very slightly soluble in chloroform and ether.

Colour Test Liebermann's reagent—red-orange.

Thin-layer Chromatography System TD—R_f 0.64; system TE—R_f 0.18; system TF—R_f 0.62; system TX—R_f 0.12; system TY—R_f 0.11; system TAD—R_f 0.64 (acidified potassium permanganate solution—positive).

Gas Chromatography System GA—warfarin RI 1432, warfarin-Me RI 2580, M (OH-) isomer 1 Me₂ RI 2810, M (OH-) isomer 2 Me₂ RI 2830, M (OH-) isomer 3 Me₂ RI 2870.

High Performance Liquid Chromatography System HX—RI 546; system HY—RI 514; system HZ—RT 9.4 min; system HAX—RT 8.0 min; system HAY—RT 8.3 min.

Column: Astec β-cyclodextrin (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: glacial acetic acid: triethylamine (1000:3:2.5), flow rate 1.0 mL/min. UV detection (λ = 320 nm). Retention time: (S)-warfarin 6.9 min, (R)-warfarin 7.7 min [Ring, Bostick 2000].

Column: Chiralcel OD (250 × 4.6 mm i.d., 10 μm). Mobile phase: isopropanol: acetic acid: hexane (18:0.5:81.5), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 320 nm, λ_{em} = 415 nm). Resolution factor: warfarin, 5.6, 7-hydroxywarfarin 4.5. Retention time: (R)-warfarin 13.1 min, for (S)-warfarin 25.3 min. Limit of detection, 20 μg/L for (R)-warfarin, 40 μg/L for (S)-warfarin [Takahashi *et al.* 1997].

Ultraviolet Spectrum Aqueous acid—270, 280, 303 nm; aqueous alkali—293, 308 nm (A₁ = 462a).

Infrared Spectrum Principal peaks at wavenumbers 1517, 1599, 1640, 750, 1700, 692 cm⁻¹ (warfarin sodium, KBr disk).

Mass Spectrum Principal ions at m/z 265, 308, 121, 43, 266, 187, 213, 251.

Quantification

Blood HPLC Column: C₈ Symmetry (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: phosphate buffer (pH 3.8, 13:87 for 1 min to 35:65 at 9 min to 80:20 at 28 min for 2 min to 13:87 until 35 min), flow rate 0 mL/min. UV detection (λ = 200–400 nm). Limit of quantification, 400 μg/L [Denooz *et al.* 2009]. Column: XDBC (150 × 2.1 mm i.d., 5 μm). Mobile phase: 2% methanol and 2% aqueous acetic acid (88:12), flow rate 0.5 mL/min. Fluorescence detection. Limit of quantification, 0.05 mg/L for warfarin and 0.01 mg/L for other 4-hydroxycoumarin rodenticides [Jin *et al.* 2007].

Plasma GC FID. Limit of detection, 0.3 mg/L [Hanna *et al.* 1978].

HPLC UV detection [Sadrai *et al.* 2008]. Column: Chiralcel OD-RH (150 × 4.6 mm i.d.). Mobile phase: phosphate buffer: acetonitrile (pH 2.0, 45:55). UV detection (λ = 312 nm). Limit of quantification, 3.0 μg/L for warfarin and 7-hydroxywarfarin enantiomers [Uno *et al.* 2007]. Column: Phenomenex C₁₈ (150 × 4.6 mm i.d., 5 μm). Mobile phase: methanol: 50 mmol/L ammonium acetate buffer (pH 3.74, 67:33), flow rate 1.2 mL/min. UV detection (λ = 308 nm). Limit of quantification, 0.12 mg/L [Sun *et al.* 2006]. Column: Pirkle (R,R) Whelk-01 (250 × 4.6 mm i.d., 5 μm). Mobile phase: methanol: acetonitrile: water (50:10:40) with 0.1% glacial acetic acid, flow rate 1 mL/min. UV detection (λ = 305 nm). Limit of detection, 16 μg/L for (S)-warfarin and 18 μg/L for (R)-warfarin [Osman *et al.* 2005]. Column: chiral AGP (100 × 3.0 mm i.d., 5 μm) or ODS Hypersil C₁₈ (100 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: 50 mmol/L phosphate buffer (pH 7.0, 15:85), flow rate 0.9 mL/min. UV detection (λ = 310 nm). Limit of detection, 25 μg/L for warfarin enantiomers and 4'-, 10-, 6-, and 7-hydroxywarfarin; 35 μg/L for 8-hydroxywarfarin; and 50 μg/L for racemic warfarin [Locatelli *et al.* 2005]. Column: reversed phase ovomucoid silica (150 × 4.6 mm i.d., 5 μm). Mobile phase: 0.05 mol/L ammonium acetate (pH 4.7): acetonitrile (90:10), flow rate 1.0 mL/min. Fluorometric detection (λ_{ex} = 313 nm, λ_{em} = 400 nm). Limit of quantification, 25 μg/L for warfarin enantiomers [Boppana *et al.* 2002]. See also Cai *et al.* [1994], Huang *et al.* [2001], Lombardi *et al.* [2003], Naidong, Lee [1993], Ring, Bostick [2000] and Takahashi *et al.* [1997].

LC-MS Column: Acquity UPLC BEH C₁₈ (50 × 2.1 mm i.d., 1.7 μm). Mobile phase: 0.1% formic acid: acetonitrile (50:50). MRM acquisition mode. Limit of quantification, 0.25 μg/L free warfarin [Huang *et al.* 2008]. Column: reverse phase Luna C₁₈ (100 × 2.0 mm i.d., 3 μm). Mobile phase: 2% acetonitrile-25 mmol/L formic acid: 70% acetonitrile-25 mmol/L formic acid (45:55 for 5 min to 0:100 for 2 min to 45:55 for 4 min), flow rate 0.3 mL/min. ESI, SIM acquisition mode. Limit of quantification, ≤40 nmol/L for warfarin and phenprocoumon and

≤25 nmol/L for metabolites, limit of detection, ≤1 nmol/L [Ufer *et al.* 2004]. Column: Symmetry C₁₈ (150 × 3.0 mm i.d., 5 μm). Mobile phase: acetonitrile: 1 g/L formic acid (75:25), flow rate 0.5 mL/min. ESI, positive ion mode. Retention time: 2.53 min. Limit of detection, 1 μg/L [Kollroser, Schober 2002]. Column: β-cyclodextrin. Mobile phase: acetonitrile: acetic acid: triethylamine (1000:3:2.5). ESI. Limit of quantification, 1 μg/L [Naidong *et al.* 2001].

SFC-MS Column: Chiralpak AD (250 × 4.6 mm i.d.). Mobile phase: ethanol: CO₂ (30:70), flow rate 4.9 mL/min. APCI, MRM acquisition mode. Limit of quantification, 13.6 μg/L for (R)- and (S)-warfarin [Coe *et al.* 2006].

CE-MS Capillary: fused silica (1.2 m × 50 μm i.d.). Mobile phase: methanol: water (80:20) containing 5 mmol/L ammonium acetate (pH 6.8), flow rate 5 μL/min. ESI, SIM acquisition mode. Limit of detection, 0.1 mg/L for warfarin enantiomers [Hou *et al.* 2007].

Immunoassay See Fitzpatrick, O'Kennedy [2004].

Urine GC-MS Column: HP-1 capillary (12 m × 0.2 mm i.d., 0.33 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 8 min. EI ionisation at 70 eV, full scan mode. Limit of detection not reported [Maurer, Arlt 1998].

HPLC Column: cellulose derivative. UV and fluorescence detection. Limit of detection, 2.5 μg/L for 7-hydroxywarfarin enantiomers and 4.5 μg/L for (S)-hydroxywarfarin [Takahashi *et al.* 1997].

LC-MS See Plasma. Limit of detection, ≤2.5 nmol/L [Ufer *et al.* 2004].

Disposition in the Body Warfarin is readily and almost completely absorbed after oral administration, with peak concentrations observed within the first 4 h. The (R)-enantiomer of warfarin is metabolised mainly by reduction to (R,S)-3'-hydroxywarfarin although 6-hydroxylation also occurs. The (S)-enantiomer is metabolised mainly by 6- and 7-hydroxylation with smaller amounts of the (S)-3'-hydroxy metabolite; the reduced metabolites are less active than warfarin; the 6- and 7-hydroxy metabolites are inactive. Other metabolites include warfarin sodium alcohols, including dehydrowarfarin sodium and 2 diastereoisomer alcohols, which have minimum activity. <1% of a dose is excreted in the urine as unchanged drug. Approximately 16–43% of a single dose is excreted in the urine as free or conjugated metabolites in 6 days. Excretion also occurs, to a lesser extent, through bile.

Therapeutic Concentration In plasma, usually in the range 1–3 mg/L but there are considerable inter-subject variations in sensitivity to warfarin and measurement of the plasma concentration is generally of little value since the pharmacological effect can be easily measured.

In 6 subjects receiving daily oral doses of 5–11 mg warfarin, steady-state plasma concentrations of 1.2–2.6 mg/L were attained [Orme *et al.* 1977].

Following a single oral dose of 50 mg warfarin to 8 subjects, peak plasma concentrations of 5.2–10.9 mg/L (mean, 7.2) were attained in 0.3–3 h (mean, 1.5) [Welle-Watne, Jahren. 1980].

Six men with ischemic stroke, aged between 61 and 69 years, participating in a warfarin-aspirin recurrent stroke study, were administered 4–6 mg warfarin daily for at least 1 week. The mean plasma concentration observed was 0.47 mg/L (range, 0.16–0.66) for (S)-warfarin and 0.69 mg/L (0.42–0.97) for (R)-warfarin [Cai *et al.* 1994].

Toxicity Toxic effects are associated with plasma concentrations >10 mg/L. The maximum permissible atmospheric concentration is 0.1 mg/m³.

In a patient who took an overdose of warfarin (2000 mg by mouth plus 25 × 10⁴ U administered SC), a plasma concentration of 111 mg/L was reported on the day of admission (the day after the overdose). Concentrations fell steadily in an approximate first-order fashion to 0.2 mg/L 10 days after the overdose [Hackett *et al.* 1985].

In a study involving 226 patients (mean age 62.7 years), the mean starting dose of warfarin was 3.4 mg daily (range, 1.3–10.0) and the mean maintenance dose was 3.1 mg daily (range, 1.2–7.7). Of these 226 patients, 55 survived a haemorrhage, with the most common place being the gastrointestinal tract. Three of the patients died as a result of their haemorrhage, 23 required medical treatment and 29 were uneventful. One female, who had breast cancer with multiple metastases, was being treated with warfarin for deep-vein thrombosis. She suffered a gastrointestinal tract haemorrhage 1 month after warfarin treatment had started and died. The second fatality was a male patient who was treated with warfarin for a period of 1.8 months for cerebrovascular disease. He died of an intracranial haemorrhage. The final fatality was also treated for cerebrovascular disease and was treated for 5 months before haemorrhaging from multiple sites [Chenhsu *et al.* 2000].

A 15-year-old boy who took an overdose of warfarin (50 tablets of 5 mg each and 100 tablets of 1 mg each) as well as allopurinol (14 tablets of 300 mg each) had an international normalised ratio (INR) on admission of 1.1. He was given 10 mg vitamin K injections on day 1 and 5. On day 3, his INR peaked at 5.0, at which point he was given the first of two infusions of fresh frozen plasma. His INR became normal after 5 days [Ramanan *et al.* 2002].

For a report of warfarin poisoning from ingestion of a rodenticide, see Matsuda *et al.* [2008].

Half-life Plasma half-life, 15–85 h (mean, 42), decreased in subjects with renal disease. The half-life of the (R)-enantiomer (mean, ~45 h; range, 37–89) appears to be longer than that of the (S)-enantiomer (mean, ~30 h; range, 21–43).

Volume of Distribution 0.05–0.25 L/kg (mean, 0.15).

Clearance Plasma clearance, 0.02–0.08 mL/min/kg (mean, 0.04).

Distribution in Blood Plasma: whole blood ratio, ~1.8.

Protein Binding 97–99%, reduced in renal impairment.

Note For a review of warfarin metabolism and mode of action, see Park [1988].

Dose Maintenance, usually 3 to 9 mg warfarin sodium daily.

Xamoterol

Cardiotonic, β -Adrenoceptor Partial Agonist

$C_{16}H_{25}N_3O_5 = 339.4$

CAS—81801-12-9

IUPAC Name *N*-[2-[[2-Hydroxy-3-(4-hydroxyphenoxy)propyl]amino]ethyl]morpholine-4-carboxamide

Chemical Properties Crystals. Mp 168° to 169°. Log *P* (octanol/water), -1.11.

Xamoterol Hemifumarate

$(C_{16}H_{25}N_3O_5)_2 \cdot C_4H_4O_4 = 794.8$

CAS—90730-93-1

Synonym ICI-118587

Proprietary Names *Corwil*; *Corwin*; *Xamtol*.

Thin-layer Chromatography System TB— R_f 0.00; system TE— R_f 0.15; system TF— R_f 0.00; system TAE— R_f 0.18.

Plate: silica gel Merck 60 F₂₅₄. Mobile phase: toluene : ethanol : ethyl acetate : ammonium hydroxide (6 : 4 : 2 : 1). R_f value: 0.10 (sulfate conjugate) [Marten *et al.* 1984].

High Performance Liquid Chromatography System HX—RI 239.

Ultraviolet Spectrum Aqueous acid—280 nm (xamoterol); 270 nm (sulfate metabolite); 275 nm (glucuronide metabolite); aqueous alkali—300 nm (xamoterol).

Quantification

Blood HPLC Column: Hypersil-ODS (150 × 4.1 mm i.d., 5 μ m). Mobile phase: methanol : tetrahydrofuran (THF) : 30 mmol/L perchloric acid (8.0 : 0.6 : 91.4), flow rate 1.5 mL/min. Retention time: 8 min. Electrochemical detection. Limit of detection, 0.002 mg/L [Davis 1987]. Column: Lichrospher 60 RP Select B (125 × 4 mm i.d., 5 μ m). Mobile phase: acetonitrile : 20 mmol/L ammonium acetate (55 : 45), flow rate 2 mL/min. IS: prenalteol. Fluorescence detection (λ_{ex} =190 nm; λ_{em} =320 to 400 nm). Retention time: xamoterol, 6.9 min; IS, 5.8 min. Limit of detection, 0.001 mg/L [Oddie *et al.* 1984].

Urine HPLC See Blood. Limit of detection, 0.01 mg/L [Oddie *et al.* 1984].

Disposition in the Body The drug is poorly absorbed from the gastrointestinal tract. A small amount is metabolised to inactive sulfate conjugates. Glucuronide metabolites have also been identified. Xamoterol is excreted mainly in urine as the unchanged drug and its metabolite(s). Most of the absorbed drug is eliminated within 24 h. Maximum plasma concentrations are reached within 1 to 2 h, although in the elderly the plasma concentrations are increased.

Therapeutic Concentration

The mean maximal plasma concentration after a 200 mg oral dose is 0.189 mg/L in young healthy individuals, and 0.134 mg/L in the elderly. In individuals with ischaemic heart disease, the mean maximum plasma concentrations were 0.128, 0.264 and 0.403 mg/L after 200, 400 and 600 mg doses, respectively [Furlong, Brogden 1988].

Six patients with liver disease (mostly alcohol induced), aged between 29 and 69 years (mean, 56.5 years) and 6 healthy individuals (34 to 68 years; mean, 56 years) were administered 0.2 mg/kg xamoterol IV over 5 min followed by a single oral dose of 200 mg. The peak plasma concentrations after the IV dose were 0.715 mg/L for the patients and 0.691 mg/L for the healthy individuals. For the oral dose, peak concentrations were 0.149 and 0.138 mg/L, respectively [Nicholls *et al.* 1989].

Bioavailability 5%.

Half-life 16 h.

Volume of Distribution 1.12 L/kg.

Clearance Total plasma clearance, 0.18 to 0.3 L/h/kg.

Protein Binding 3%.

Dose 200 to 400 mg daily.

Xantinol Nicotinate

Vasodilator

$C_{13}H_{21}N_5O_4 \cdot C_6H_5NO_2 = 434.5$

CAS—2530-97-4 (xantinol); 437-74-1 (nicotinate)

IUPAC Name 7-[2-Hydroxy-3-[2-hydroxyethyl(methyl)amino]propyl]-1,3-dimethylpurine-2,6-dione; pyridine-3-carboxylic acid

Synonyms 3-Pyridinecarboxylic acid compound with 3,7-dihydro-7-[2-hydroxy-3-[(2-hydroxyethyl)methylamino]propyl]-1,3-dimethyl-1*H*-purine-2,6-dione (1 : 1); xanthinol nicotinate; xantinol niacinate

Proprietary Names *Complamin*; *Frigol*; *Vedrin*.

Chemical Properties Colourless crystals. Mp 180°. Freely soluble in water. Log *P* (octanol/water), -1.8.

Colour Tests Amalic acid test—orange/violet; cyanogen bromide—orange.

Thin-layer Chromatography System TA— R_f 0.41; system TE— R_f 0.21; system TF— R_f 0.00; system TAE— R_f 0.26 (acidified potassium permanganate solution, positive).

Gas Chromatography System GA—xantinol-AC₂ RI 2870.

High Performance Liquid Chromatography System HX—RI 215.

Ultraviolet Spectrum Aqueous acid—267 nm ($A_1^1=300a$). Xantinol: aqueous acid—273 nm ($A_1^1=270b$).

Infrared Spectrum Principal peaks at wavenumbers 1658, 1695, 1548, 763, 750, 1029 cm^{-1} (xantinol, KBr disk).

Dose 450 to 900 mg daily.

Xenysalate

Anaesthetic (Local), Antibacterial, Antifungal

$C_{19}H_{23}NO_3 = 313.4$

CAS—3572-52-9

IUPAC Name 2-Diethylaminoethyl 2-hydroxy-3-phenylbenzoate

Synonyms Biphenamine; 2-diethylaminoethyl 2-hydroxy-3-biphenylcarboxylate; 2-diethylaminoethyl 3-phenylsalicylate; 2-diethylaminoethyl 3-phenylsalicylate; 3-phenylsalicylic acid 2-diethylaminoethyl ester.

Chemical Properties Oily liquid. Soluble in water. Log *P* (octanol/water) 5.05 [Meylan, Howard 1995]; 5.2 [National Institutes of Health 2008].

Xenysalate Hydrochloride

$C_{19}H_{23}NO_3 \cdot HCl = 349.9$

CAS—5560-62-3

IUPAC Name 2-Diethylaminoethyl 2-hydroxy-3-phenylbenzoate hydrochloride

Proprietary Names *Sebacen*; *Sebaklen*.

Colour Tests Ammonium molybdate test—blue (limit of detection, 0.1 µg); ammonium vanadate test—green (limit of detection, 0.1 µg); sulfuric acid—formaldehyde test—olive-green (limit of detection, 0.25 µg); Vitali's test—/faint yellow/bright yellow (limit of detection, 0.1 µg).

Thin-layer Chromatography System T1— R_f 0.62 (location reagent acidified iodoplatinate spray, positive reaction).

Gas Chromatography System G2/225—retention time 1.20 relative to codeine.

Ultraviolet Spectrum 0.1 N sulfuric acid—231, 319 nm.

Dose Used in shampoos for the control of seborrheic dermatitis and dandruff [Diamond 1962; Lubowe 1963].

Diamond S (1962). Biphenamine HCl in seborrheic scalp disorders. *West Med Med J West* 3: 215–216.

Xipamide

Diuretic

$C_{15}H_{15}ClN_2O_4S = 354.8$

CAS—14293-44-8

IUPAC Name 4-Chloro-*N*-(2,6-dimethylphenyl)-2-hydroxy-5-sulfamoylbenzamide

Synonym 4-Chloro-5-sulfamoyl-2',6'-salicyloylidide

Proprietary Names *Aquaphor*; *Aquaphoril*; *Chronexan*; *Demiax*; *Diurexan*; *Lumitens*.

Chemical Properties A white crystalline substance. Mp about 260°, with decomposition. Practically insoluble in water; soluble in ethanol; very soluble in acetone; slightly soluble in chloroform and ether. pK_a 4.8 (phenol), 10.0 (sulfonamide). Log *P* (octanol/water), 2.2.

Colour Tests Koppanyi–Zwicker test—violet; Liebermann's reagent—orange; Mandelin's test—blue; mercurous nitrate—black

Thin-layer Chromatography System TB— R_f 0.00; system TD— R_f 0.38; system TE— R_f 0.13; system TF— R_f 0.64; system TAD— R_f 0.36; system TAE— R_f 0.93.

Gas Chromatography System GA—xipamide-Me₂ RI 3350, xipamide-Me₄ RI 2780, M (OH)-Me₄ RI 3000, xipamide isomer-1Me₃ RI 2800, xipamide isomer-2Me₃ RI 3320, art (-SO₂NH) RI 2385, art (-SO₂NH)-Me RI 2480, art (-SO₂NH)-Me₂ RI 2115.

High Performance Liquid Chromatography System HX—RI 488; system HAA—retention time 18.8 min.

Ultraviolet Spectrum Aqueous acid—296 nm ($A_1^1=92b$); aqueous alkali—330 nm ($A_1^1=160b$).

Infrared Spectrum Principal peaks at wavenumbers 1163, 1635, 1578, 1560, 975, 1525 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 121, 120, 354, 122, 43, 234, 106, 64.

Quantification

Plasma TLC–spectrofluorimetry Limit of detection, <10 µg/L [Sobel, Mutschler 1980].

Urine HPLC UV detection. For method, see Rosado-Maria *et al.* [2000]. UV detection. For method, see Diembeck *et al.* [1982].

TLC–spectrofluorimetry For method, see Sobel and Mutschler [1980].

Disposition in the Body Completely and fairly rapidly absorbed after oral administration. About 88% of a dose is excreted in the urine in 48 h with about 50% as unchanged drug and 30% as xipamide-*O*-glucuronide; free amine metabolites have also been detected. In normal subjects, only traces are excreted in the bile, but biliary excretion may be extensive in renal failure.

Half-life Plasma half-life, about 5 to 8 h.

Protein Binding About 99%.

Dose Usually 20 to 40 mg daily; doses of 80 mg daily have been given.

Diembeck W *et al.* (1982). [Pharmacokinetics of xipamide and triamterene in healthy probands]. *Arzneimittelforschung* 32: 1482–1485.

Xylazine

α_2 -Adrenoceptor Agonist, Analgesic (Veterinary), Sedative (Veterinary)

$C_{12}H_{16}N_2S = 220.3$

CAS—7361-61-7

IUPAC Name *N*-(2,6-Dimethylphenyl)-5,6-dihydro-4*H*-1,3-thiazin-2-amine

Chemical Properties Colourless crystals. Mp 140° to 142°; also reported as 136° to 139°. Practically insoluble in water and alkalis; soluble in dilute acids, benzene, acetone and chloroform; sparingly soluble in petroleum ether. Log *P* (octanol/water), 4.52.

Xylazine Hydrochloride

$C_{12}H_{16}N_2S \cdot HCl = 256.8$

CAS—23076-35-9

Synonym Bay-Va-1470

Proprietary Names *Narcoxy*; *Rompun*; *Solvazine*; *Xylapan*; *Xylasol*.

Chemical Properties A white powder. Mp 164° to 167°. Readily soluble in water, ethanol and methanol; very slightly soluble in chloroform and ether.

Colour Tests Liebermann's reagent—red; Mandelin's test—blue.

Thin-layer Chromatography System TA— R_f 0.60; system TE— R_f 0.78; system TAJ— R_f 0.08; system TAK— R_f 0.06; system TAL— R_f 0.70 (acidified iodoplatinate solution—positive).

Gas Chromatography System GV—RT 11.6 min.

Ultraviolet Spectrum

Infrared Spectrum Principal peaks at wavenumbers 1613, 1585, 1164, 1314, 1085, 1099 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at m/z 205, 77, 41, 39, 220, 130, 145, 131.

Quantification

Blood GC-MS Column: 5% phenylmethylsiloxane (12 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1 mL/min. Temperature programme: 120° for 1 min to 270° at 20°/min for 7 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 5.91 min. Limit of quantification, 10 $\mu\text{g/L}$, limit of detection, 2 $\mu\text{g/L}$ [Barroso *et al.* 2007]. Column: 3% OV-17 on 100/120 mesh Gas Chrom Q (1.8 m × 2 mm i.d.). Carrier gas: He, 20 mL/min. Temperature programme: 180° for 2 min to 230° at 20°/min. EI ionisation at 70 eV. Limit of detection, 100 $\mu\text{g/L}$ [Gallanosa *et al.* 1981].

Plasma HPLC UV detection. Limit of quantification, 25 $\mu\text{g/L}$, limit of detection, 5 $\mu\text{g/L}$ [Hoffmann *et al.* 2001].

Urine GC-MS Limit of detection, 20 $\mu\text{g/L}$ [Olmos-Carmona, Hernandez-Carrasquilla 1999]. See Blood [Gallanosa *et al.* 1981].

Disposition in Body Xylazine is metabolised in the liver to ~20 metabolites. A major metabolite is 2,6-dimethylaniline. Both the unchanged drug and metabolites have been detected in urine.

Toxicity

A fatal case of multiple drug abuse in a 36-year-old veterinarian is reported involving injection of xylazine and ingestion of alcohol and clorazepate. Xylazine levels were 0.2 mg/L in blood, 0.4 mg/kg in brain, 0.6 mg/kg in kidney, 0.9 mg/kg in liver, 1.1 mg/kg in lung, 0.05 mg/kg in omentum adipose and 7.0 mg/L in urine [Poklis *et al.* 1985].

A 59-year-old woman who was a known former alcoholic was found dead at her home. Various empty containers of a number of drugs were found in her bedroom. After toxicological analysis, xylazine was found in her urine at a concentration of 30 mg/L, in her blood at 16 mg/L and there was a large amount in her stomach contents. Traces of lorazepam could also be detected and ethanol was found in her blood at 0.78 mg/g [Briellmann *et al.* (1994)].

A 27-year-old farmer attempted to commit suicide by injecting himself IM with 1.5 g xylazine (~75 mL of a 2% xylazine solution). As a result, he became comatose with no light/pain response; he was hypotensive, bradycardic and mildly glycaemic and suffered from respiratory depression. He was admitted to hospital 2 h after ingestion and was treated in the intensive care unit with artificial respiration and IV fluid therapy. The highest concentration of xylazine in plasma was 4.6 mg/L; xylazine was 446 mg/L in gastric fluid and 194 mg/L in urine. The level of drug decreased over 12 h and he regained consciousness after 20 h. He was discharged from hospital 4 days after admission [Hoffmann *et al.* 2001].

The 16-year-old son of a horse breeder developed signs consistent with α -adrenergic agonist toxicity 2 h after an overdose of xylazine (the xylazine solution had been dried on a CD case, scraped up into a bag and then snorted).

The patient recovered after appropriate supportive measures. A sample of blood taken ~2 h after inhalation contained 0.54 mg/L xylazine [Capraro *et al.* 2001].

In a suicide by hanging, xylazine was the sole drug detected in tissues; the concentrations were heart blood 2.3 mg/L, peripheral (subclavian) blood 2.9 mg/L, bile 6.3 mg/L, urine 0.01 mg/L, liver 6.1 $\mu\text{g/g}$ and kidney 7.8 $\mu\text{g/g}$ [Moore *et al.* 2003].

Xylazine levels in blood of 0.57 mg/L were reported in a case of suspected impaired driving involving self-administration of xylazine (*Xylo-Ject*) and paroxetine [Stillwell 2003]. Fatal toxicity in two homicide victims is reported with xylazine up to 1800 mg being used to cause death [Mittleman *et al.* 1998].

Seven cases of drug-related deaths in which illicit drugs (such as heroin and cocaine) were adulterated with xylazine have been described. Xylazine was detected in urine in all 7 cases and blood in 3 cases (levels ranged from trace–130 $\mu\text{g/L}$) [Wong *et al.* 2008].

For a further report of toxicity from inhaled xylazine, see Elejalde *et al.* [2003]; for a literature review of xylazine toxicity, see [Mittleman *et al.* 1998]; for a further report of xylazine overdose, see Gallanosa *et al.* [1981].

Xylene

Solvent

C_8H_{10} = 106.2

CAS—1330-20-7; 108-38-3 (*m*-Xylene); 95-47-6 (*o*-Xylene); 106-42-3 (*p*-Xylene)

Synonym Xylol(e)

Proprietary Names *Cerulisinga; Cerulyse; Novo-Cerulol.*

Chemical Properties A mixture of *o*-, *m*- and *p*-dimethylbenzene in which the *m*-isomer predominates. A colourless, flammable liquid. Mass per mL about 0.86 g. Bp 137° to 140°. Practically insoluble in water; miscible with absolute ethanol, ether and other organic solvents. Log *P* (octanol/water), 3.2.

Gas Chromatography System GA—*o*-xylene RI 884, *m*-xylene RI 863, *p*-xylene RI 860; system GI—*o*-xylene retention time 34.5 min, *m*-xylene retention time 33.2, *p*-xylene retention time 34.2 min.

High Performance Liquid Chromatography System HAA—retention time 24.0 min.

Ultraviolet Spectrum

Mass Spectrum Principal ions at m/z 91, 106, 105, 77, 51, 39, 29, 92 (*m*-xylene).

Quantification

Blood GC Limit of detection, about 20 µg/L for *o*-, *m*- and *p*-xylene [Hattori *et al.* 1998]. ECD. For a method for the quantification of musk xylene (a synthetic musk), see Angerer and Kafferlein [1997]. Ion-trap detection. For a method for the quantification of xylene isomers and other volatile organic compounds, see Schuberth [1996].

GC and GC-MS For a method for the quantification of xylenes and other volatile compounds, using headspace analysis, see Bellanca *et al.* [1982].

Urine GC PID, ECD, FID. Limit of detection, 26 to 67 ng/L for xylene and other volatile compounds [Schroers *et al.* 1998]. Limits of detection, 0.1 to 0.2 mg/L for xylene isomers and other phenolics [Bieniek 1996]. AFID. Limit of detection, 1.0 mg/L for *m*- and *p*-methylhippuric acids [Morin *et al.* 1981].

GC and GC-MS Limit of detection, 12 to 34 ng/L for xylenes, benzene, toluene and ethylbenzene, using headspace analysis [Fustinoni *et al.* 1999].

HPLC For a method of quantification for *o*-, *m*- and *p*-methylhippuric acids and other aromatic hydrocarbon metabolites, see Burrini [1998]. For a method of quantification for xylene isomers and metabolites and other organic solvents, see Moon *et al.* [1997]. For a method for the quantification of *o*-, *m*- and *p*-xylene metabolites, see Ogata and Taguchi [1987]; Ogata and Taguchi [1988]; Astier [1992].

Body Fluids GC For a method for the quantification of xylene isomers and other volatile organic compounds, see Watanabe-Suzuki *et al.* [2002].

Postmortem Tissue GC See Blood [Schuberth 1996].

Tissues GC and GC-MS See Blood [Bellanca *et al.* 1982].

Disposition in the Body The three isomers of xylene are absorbed from the gastrointestinal tract, through the skin and from the lungs. The main metabolic reactions are oxidation of a methyl group to give the corresponding *o*-, *m*- or *p*-toluic acid and conjugation with glycine to *o*-, *m*- or *p*-methylhippuric acid; about 70% of the absorbed material is excreted as these conjugates in the urine in 18 h. Hydroxylation of the xylenes to the corresponding xylenols also occurs and these may be excreted in the urine as conjugates. About 5% of a dose is excreted unchanged in expired air and <0.01% in the urine.

Blood Concentration

Exposure to a concentration of 100 ppm of *m*-xylene, for 6 h, produced a mean peak blood-xylene concentration of about 1.0 mg/L in 4 subjects at rest; when the concentration was increased to 200 ppm for 3 h, the mean peak blood concentration was about 2.1 mg/L [Savolainen *et al.* 1979].

In a paint factory, average ambient-air concentrations of xylene were 5 to 58 ppm (average, 29) during production and 3 to 21 ppm (average, 8) during spraying; the blood concentrations of xylenes in 10 production workers were 63 to 715 µg/L (average, 380) and 49 to 308 µg/L (average, 130) in 10 spray workers [Kramer *et al.* 1999].

Toxicity Xylene has about the same acute toxicity as benzene or toluene. The maximum permissible atmospheric concentration is 100 ppm. Exposure to air concentrations of 10 000 ppm has been reported to cause unconsciousness or death.

Two men, aged 51 and 55 years, died in two separate incidents after ingestion of petrol which contained xylenes. The following postmortem concentrations of xylene in body tissues were reported: blood 20 and 3.0 mg/L, and liver 1.0 µg/g for both subjects. A woman of 55, found dead, had the following postmortem concentrations of xylene in body tissues: blood 40 mg/L, liver 1.0 µg/g [Bonnichsen *et al.* 1966].

A 27-year-old man committed suicide by ingesting a large quantity of xylene. A high level was detected in his blood (0.11 g/L), gastric contents (8.8 g/L), and duodenal contents (33 g/L) [Abu Al Ragheb *et al.* 1986].

A 20-year-old man who attempted suicide by IV injecting 8 mL of xylene (0.1 mL/kg) developed acute pulmonary failure after 10 min and eventually recovered following haemoperfusion and haemodialysis [Sevcik *et al.* 1992].

Half-life Blood half-life, about 20 to 30 h.

Xylometazoline

Sympathomimetic

C₁₆H₂₄N₂ = 244.4

CAS—526-36-3

IUPAC Name 2-[(4-Tert-butyl-2,6-dimethylphenyl)methyl]-4,5-dihydro-1H-imidazole

Chemical Properties Mp 131° to 133°. Log *P* (chloroform/water), 5.4.

Xylometazoline Hydrochloride

C₁₆H₂₄N₂·HCl = 280.8

CAS—1218-35-5

Proprietary Names Amidrin; Balkis; Dorenasin; Gelonasal; Nasolin; Olynth; Otalgicin; Otradrops; Otraspay; Otrivin(e); Otrivina; Otrix; Passagen; Rhinidine; Rinosedin; Xylo; Xylolin; Xyloma; Xylovit; Zymelin.

Chemical Properties A white crystalline powder. Mp 300°, with decomposition. Soluble 1 in 33 of water; soluble in ethanol and methanol; practically insoluble in ether or benzene.

Colour Tests Mandelin's test—red; Marquis test—orange.

Thin-layer Chromatography System TA—R_f 0.13; system TB—R_f 0.07; system TC—R_f 0.05; system TE—R_f 0.30; system TL—R_f 0.03; system TAE—R_f 0.05; system TAF—R_f 0.64. (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—xylometazoline RI 2020, xylometazoline-AC RI 2260.

High Performance Liquid Chromatography System HA—*k* 1.6; system HX—RI 413.

Ultraviolet Spectrum Aqueous acid—265 nm (A₁¹=11.5a).

Infrared Spectrum Principal peaks at wavenumbers 1602, 1253, 1298, 871, 1237, 800 cm⁻¹ (xylometazoline hydrochloride, KBr disk).

Mass Spectrum Principal ions at m/z 244, 229, 44, 173, 40, 230, 243, 245.

**Quantification**

Plasma GC ECD. For method, see Sioufi *et al.* [1989].

Urine GC See Plasma [Sioufi *et al.* 1989].

Disposition in the Body**Toxicity**

The following postmortem concentrations were reported in a 23-year-old man who died after the IV self-administration of xylometazoline: blood 0.14 mg/L, liver blood 0.37 mg/L [Vanezis, Toseland 1980].

Use In concentrations of 0.05 to 0.1% of the hydrochloride, as nasal drops or spray.

Sioufi A *et al.* (1989). Determination of xylometazoline in plasma and urine by gas chromatography using a fused-silica capillary column and an electron-capture detector. *J Chromatogr* 487: 81–89.

Yessotoxin

Cardiotoxin, Sulfated Polyether

$C_{55}H_{78}O_{21}S_2Na_2 = 1185.3$

CAS—112514-54-2

Synonym YTX

Chemical Properties Brevetoxin-type toxin produced by the dinoflagellates *Protoceratium reticulatum* and *Lingulodinium polyedrum*. It was first isolated in 1986 from the scallop *Patinopecten yessoensis* [Draisci *et al.* 1996; Van Egmond *et al.* 1993]. Almost 40 yessotoxin (YTX) analogues have since been detected and characterised in different shellfish and dinoflagellate samples. The major analogues are homo-YTX, 45-hydroxyhomo-YTX, and their carboxy derivatives [Paz *et al.* 2004].

Mass Spectrum Principal ions at *m/z* 1142, 1164.

Quantification

Other HPLC Dinoflagellate Cultures (*P. reticulatum*). Column: Lichrospher C₁₈ (125 × 4.6 mm i.d., 5 μm). Mobile phase: 100 mmol/L ammonium acetate (pH 5.8):methanol (3:7), flow rate 0.75 mL/min. Fluorescence detection (λ_{ex} = 370 nm, λ_{em} = 440 nm). Retention time: 2 peaks ≈17 min (4-(2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalimylethyl)-1,2,4-triazoline-3,5-dione), DMEQ-TAD derivative). Limit of quantification not reported [Paz *et al.* 2004, 2006; Satake *et al.* 1999; Yasumoto, Takizawa 1997]. Mussel Samples. Column: Cosmosil C₁₈ (250 × 4.6 mm i.d., 5 μm). Mobile phase: 40 mmol/L phosphate buffer (pH 5.8):methanol (3:7), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 370 nm, λ_{em} = 440 nm). Retention time: YTX two peaks ≈15 min, 1-desulfo-YTX two peaks ≈30 min (both DMEQ-TAD derivatives). Limit of quantification not reported [Daiguji *et al.* 1998].

LC-MS Mussel Hepatopancreas Samples (*Mytilus galloprovincialis*). Column: Hypersil C₈ (50 × 2.0 mm i.d., 3 μm). Mobile phase: water:acetonitrile-water (95:5) both containing 5 mmol/L ammonium acetate (pH 7; 80:20 to 0:100 over 10 min for 15 min), flow rate 0.2 mL/min. Turbospray, negative ion mode, SIM acquisition mode. Retention times: YTX 9 min, 45-hydroxy-YTX 8 min, carboxy-YTX 7 min. Limit of quantification not reported [Morton *et al.* 2007].
Dinoflagellate Cultures (*P. reticulatum*). Column: Hypersil C₈ (50 × 2.1 mm i.d., 3 μm). Mobile phase: water:acetonitrile-water (95:5)-2 mmol/L ammonium formate-50 mmol/L formic acid (80:20 to 0:100 over 10 min for 15 min), flow rate 0.2 mL/min. ESI, negative ion mode, MRM acquisition mode. Retention times: YTX 10.1 min, noroxo-YTX-enone 8.2 min, 45,46,47-trinor-YTX 9.5 min, 45,46,47-trino-1-homo-YTX 9.5 min, 1-homo-YTX 10.1 min. Limit of quantification not reported [Suzuki *et al.* 2007]. Column: Lichrospher C₁₈ (125 × 4.6 mm i.d., 5 μm). Mobile phase: 20 mmol/L ammonium acetate (pH 5.8):methanol (3:7), flow rate 0.2 mL/min. ESI, negative ion mode, SIM acquisition mode. Retention time: 9.8 min. Limit of quantification not reported [Paz *et al.* 2004, 2006]. Column: C₁₈ (150 mm × 75 μm, 3 μm). Mobile phase: acetonitrile:water (90:10)-1 mmol/L ammonium acetate, flow rate 400 nL/min. NanoESI, negative ion mode, MRM acquisition mode. Retention time: 14 min. Limit of quantification, 0.75 μg/L [Ruppen Canas *et al.* 2004]. Mussel Tissue Samples. Column: Hypersil C₈ (50 × 2.0 mm i.d., 3 μm). Mobile phase: acetonitrile:water-3.5 mmol/L ammonium formate-50 mmol/L formic acid (9.5:90.5 to 95:5 over 10 min for 15 min), flow rate 0.2 mL/min. ESI, negative ion mode, MRM acquisition mode. Retention times: YTX 8.98 min, homo-YTX 9.01 min, 45-hydroxy-YTX 8.73 min, 45-hydroxy-homo-YTX 8.76 min, carboxy-YTX 8.18 min, carboxyhomo-YTX 8.21 min,

42,43,44,45,46,47,55-heptanor-41-oxohomo-YTX 8.04 min. Limit of detection, 7 μg/kg [Ciminiello *et al.* 2002]. Column: amide C₁₆ (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile:water (60:40) containing 0.5 mmol/L ammonium acetate, flow rate 0.5 mL/min. ESI, negative ion mode, MRM acquisition mode. Limit of detection, 3 μg/kg [Fernandez Amandi *et al.* 2002]. Column: C₁₈ (300 × 1.0 mm i.d., 5 μm). Mobile phase: acetonitrile:water (80:20) containing 2 mmol/L ammonium acetate, flow rate 0.04 mL/min. ESI, negative ion mode, SIM acquisition mode. Retention time: 4.3 min (other diarrhetic shellfish poisoning [DSP] also detected but resolved under different conditions). Limit of quantification not reported [Draisci *et al.* 1999].

CE Algae and Shellfish Samples. Column: uncoated bare fused silica capillary (total/effective length: 48.5/40.0 cm, 50 μm i.d.). Running buffer: CZE, 50 mmol/L disodium hydrogen phosphate, 40% methanol (pH 8.5); MEKC, 10 mmol/L disodium hydrogen phosphate, 35 mmol/L SDS, 20% methanol (pH 8.5). UV detection (λ = 230 nm). Retention time: CZE, 11 min; MEKC, 13.5 min. Limit of quantification, CZE 0.9 mg/L, MEKC 0.5 mg/L; limit of detection, CZE 0.3 mg/L, MEKC 0.2 mg/L [de la Iglesia *et al.* 2007].

CE-MS Algae and Shellfish Samples. Column: uncoated bare fused-silica capillary (total/effective length: 80.0/21.6 cm, 50 μm i.d.). Running buffer: 10 mmol/L ammonium acetate (pH 8.5). ESI, negative ion mode, SIM. Limit of quantification, 0.08 mg/L; limit of detection, 0.02 mg/L [de la Iglesia *et al.* 2007].

Note For the complete NMR characterisation of YTX analogues in *P. reticulatum* cultures, see Miles *et al.* [2004a, b, 2006]. For the characterisation of further analogues in mussel samples, see Ciminiello *et al.* [1997, 1999, 2000, 2001, 2003, 2007], MacKenzie *et al.* [2002], Miles *et al.* [2005], Satake *et al.* [1997], Souto *et al.* [2005]. For a large-scale purification method of YTX from *P. reticulatum* cultures and the characterisation of a novel furano-YTX, see Loader *et al.* [2007]. For extraction and cleaning methods to detect YTXs in mussels, see Alfonso *et al.* [2007]. For ELISA methods for the detection of YTX and its analogues, see Briggs *et al.* [2004]; Garthwaite *et al.* [2001] and Samdal *et al.* [2005].

Distribution in the Body

Toxicity The YTXs were formerly included in the causative toxins associated with DSP because they were found in shellfish relating to DSP together with okadaic acid and dinophysistoxins. However, YTX and its analogues do not actually induce diarrhoea, but cardiotoxic effects have been demonstrated in mice as well as neurotoxicity on cultured cerebellar neurons. The YTXs are no longer included in the DSP group [de la Iglesia *et al.* 2007; Perez-Gomez *et al.* 2006; Ruppen Canas *et al.* 2004]. At the time of writing, there are no reports of human intoxication caused by YTXs [Satake *et al.* 1999; Toyofuku 2006]. For toxicity studies of YTX and its analogues in mice, see Aune *et al.* [2002], Tubaro *et al.* [2003, 2004]. LD₅₀ in mice (IP): 80 to 100 μg/kg [Ogino *et al.* 1997].

Yohimbine

α_2 -Adrenoceptor Antagonist, Alkaloid

$C_{21}H_{26}N_2O_3 = 354.4$

CAS—146-48-5

Synonyms Aphrodine; corynine; (16 α ,17 α)-17-hydroxy-yohimban-16-carboxylic acid methyl ester; québrachine.

Chemical Properties The principal alkaloid of the bark of the yohimbe tree, *Pausinystalia yohimbe* (*Corynanthe yohimbi*) (Rubiaceae). Crystals. Mp ~234°. Sparingly soluble in water; soluble in ethanol and chloroform; moderately soluble in ether. Log *P* (octanol/water), 2.7.

Yohimbine Hydrochloride

$C_{21}H_{26}N_2O_3 \cdot HCl = 390.9$

CAS—65-19-0

Proprietary Names Antagonil; Aphrodine; Dayto Himbin; Erex; Pluriviron mono; Prowess Plain; Urobine; Yobine; Yocor; Yocoral; Yohimex; Yohydro; Yomax; Yovital; Zumba.

Chemical Properties A white crystalline powder. Mp ~302°, with decomposition. Soluble 1 in 100 of water, 1 in 400 of ethanol; more soluble in hot water and ethanol.

Colour Tests Liebermann's reagent—blue; Mandelin's test—blue→green.

Thin-layer Chromatography System TA—*R*_f 0.63; system TB—*R*_f 0.06; system TC—*R*_f 0.38; system TE—*R*_f 0.64; system TAE—*R*_f 0.66; system TAF—*R*_f 0.70; system TAG—*R*_f 0.52 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—grey).

Gas Chromatography System GA—yohimbine RI 3155, yohimbine-AC RI 3190.

High Performance Liquid Chromatography System HX—RI 348; system HY—RI 279; system HZ—RT 2.6 min; system HAA—RT 11.5 min.

Ultraviolet Spectrum Aqueous acid—271 ($A_1^1 = 211a$), 277 ($A_1^1 = 207a$), 287 nm; aqueous alkali—280 nm.

Infrared Spectrum Principal peaks at wavenumbers 1705, 741, 1197, 1160, 1290, 1135 cm^{-1} (yohimbine hydrochloride, KBr disk).

Mass Spectrum Principal ions at *m/z* 353, 354, 169, 170, 355, 156, 184, 144.

Quantification

Blood HPLC Column: Partisil 5 (250 × 2.1 mm i.d.). Mobile phase: methanol: water (95:5). Fluorescence detection ($\lambda_{ex} = 280$ nm, $\lambda_{em} = 360$ nm). Limit of detection, 50 ng/L [Owen *et al.* 1985].

Plasma HPLC Electrochemical detection. Limit of detection, 10 $\mu g/L$ [Goldberg *et al.* 1984].

LC-MS Column: LiChrosorb Si 60. Mobile phase: 0.02 mol/L sodium acetate (pH 5): methanol (5:95), flow rate 1 mL/min. Fluorometric detection ($\lambda_{ex} = 280$ nm, $\lambda_{em} = 320$ nm). Limit of detection, 1 $\mu g/L$ (yohimbine and 11-hydroxy-yohimbine) and 0.5 $\mu g/L$ (10-hydroxy-yohimbine) [Le Verge *et al.* 1992].

Serum HPLC Column: TSK-gel ODS-120T. Mobile phase: methanol: potassium phosphate buffer. Limit of detection, 0.80 $\mu g/L$ [Chiba, Isii 1990].

Urine LC-MS Column: Hypersil GOLD (100 × 2.1 mm i.d.). Mobile phase: 1% acetonitrile in 10 mmol/L formic acid:60% acetonitrile in 10 mmol/L formic acid (100:0 to 0:100 in 10 min to 100:0 for 4 min), flow rate 200 $\mu L/min$. ESI, positive ion mode SRM acquisition mode. Limit of detection, 2 $\mu g/L$ [Björnstad *et al.* 2009].

Other HPLC Rat plasma. Column: Bondapak C₁₈ (300 × 3.9 mm i.d., 10 μm). Mobile phase: water: methanol (52:48) containing 0.01 mol/L ammonium phosphate, flow rate 1.0 mL/min. Electrochemical detection. Retention time: 7.2 min. Limit of quantification, 1 $\mu g/L$ [Diquet *et al.* 1984].

Disposition in the Body

Therapeutic Concentration

In 13 healthy subjects receiving an IV bolus dose of 0.25 or 0.5 mg/kg yohimbine, peak plasma concentrations of 150 to 1140 $\mu g/L$ were achieved [Hedner *et al.* 1992].

Toxicity

A 38-year-old man experienced atrial fibrillation and memory loss after ingesting 350 mg yohimbine [Varkey 1992].

A 62-year-old male who ingested 200 mg yohimbine experienced only mild adverse effects (tachycardia, hypertension, anxiety) [Friesen *et al.* 1993].

Dose Yohimbine hydrochloride has been given in doses of up to 30 mg daily.

Björnstad K *et al.* (2009). A multi-component LC-MS/MS method for detection of ten plant-derived psychoactive substances in urine. *J Chromatogr B Analyt Technol Biomed Life Sci* 877: 1162–1168.

Zafirlukast

Leukotriene D₄ Antagonist, Antiasthmatic

C₃₁H₃₃N₃O₆S = 575.7

CAS—107753-78-6

IUPAC Name Cyclopentyl N-[3-[[[2-methoxy-4-[(2-methylphenyl)sulfonyl]carbamoyl]phenyl]methyl]-1-methylindol-5-yl]carbamate

Synonyms ICI-204219; [3-[[[2-methoxy-4-[[[(2-methylphenyl)sulfonyl]amino]carbonyl]phenyl]-methyl]-1-methyl-1H-indol-5-yl]carbamoyl]cyclopentyl ester; MK-571.

Proprietary Name Accolate

Chemical Properties A white to pale yellow powder. Mp 138° to 140°. Practically insoluble in water; slightly soluble in methanol; freely soluble in tetrahydrofuran (THF), dimethylsulfoxide and acetone.

High Performance Liquid Chromatography Column: C₁₈ Vydac reversed-phase (250 × 4.6 mm, i.d., 10 μm). Temperature: 24°. Mobile phase: acetonitrile : water (80 : 20), flow rate 1 mL/min. IS: flavone. UV detection (λ=245 nm). Retention time: zafirlukast 3.22 min; IS, 3.78 min [Ficarra *et al.* 2000].

Infrared Spectrum

Mass Spectrum Principal ions at *m/z* 463, 91, 575, 159, 185, 489, 309, 92.

Quantification

Blood HPLC Column: Zorbax CN (150 × 4.6 mm i.d., 5 μm). Mobile phase: THF : hexane : glacial acetic acid (90%) (30 : 70 : 0.1). Fluorescence detection (λ_{exc}=250 nm; λ_{em}=452 nm). Retention time: 9 to 10 min. Limit of quantification, 0.75 μg/L [Bui *et al.* 1997].

Disposition in the Body Zafirlukast is absorbed from the gastrointestinal tract, 1 to 2 h after oral administration. Food decreases the rate and the extent of absorption. It is distributed to tissue, although there is minimal distribution across the blood-brain barrier. The drug is extensively metabolised in the liver by hepatic cytochrome P450; CYP2C9 and CYP3A4. It is excreted primarily in faeces as the unchanged drug and its metabolite. Ten percent of the dose is excreted in urine following oral administration. The metabolites are at least 90 times less potent than zafirlukast. The onset of action is 1 to 2 h and peak plasma concentrations are reached within 3 h of dosing. Peak serum levels after 20 mg and 40 mg oral dose are about 150 μg/L and 250 μg/L, respectively. The steady-state plasma concentration is proportional to the dose and is achieved within 3 days. Pharmacokinetics are not changed in individuals with renal impairment but are with increased age and hepatic impairment.

Therapeutic Concentration

Five healthy male volunteers (mean age, 25.5 years) were administered 40 mg zafirlukast orally in solution, directly into the colon via an oro-enteric tube. Peak concentrations of 697 μg/L and 194 μg/L were reached for the oral and direct administration, respectively. Median times to reach these concentrations were 2.0 (1.1 to 3.0) and 1.35 (0.5 to 10.0) h, respectively [Fischer *et al.* 2000].

Half-life 10 h.

Clearance Apparent oral clearance, 11.4 L/h; decreased by 50 to 60% in the elderly and those with cirrhosis.

Protein Binding 99%; predominately to albumin.

Dose 20 mg twice daily.

Bui K *et al.* (1997). Determination of zafirlukast, a selective leukotriene antagonist, human plasma by normal-phase high-performance liquid chromatography with fluorescence detection. *J Chromatogr B Biomed Sci Appl* 696: 131–136.

Zalcitabine

Antiviral

C₉H₁₃N₃O₃ = 211.2

CAS—7481-89-2

IUPAC Name 4-Amino-1-[5-(hydroxymethyl)oxolan-2-yl]pyrimidin-2-one

Synonyms DDC; ddC; ddCyd; dideoxycytidine; 2',3'-dideoxycytidine; NSC-606170; Ro-24-2027; Ro-24-2027/000.

Proprietary Name Hivid

Chemical Properties A white to off-white crystalline powder. Mp 215° to 217°. Soluble in water and methyl alcohol; sparingly soluble in alcohol in acetonitrile, chloroform and dichloromethane; slightly soluble in cyclohexane. Log *P* (octanol/water), −1.30.

High Performance Liquid Chromatography Column: RSP cyclobond I (250 × 4.6 mm, i.d., 5 μm). Mobile phase: aqueous triethylamine (0.25%), flow rate 0.25 mL/min. IS: 2*S*-cis, 2*R*-trans and 2*S*-trans stereoisomers. Retention time: 27.1 min. UV detection (λ=270 nm). Retention time: zalcitabine, 27.1 min; 2*S*-cis, 24.9 min; 2*S*-trans, 29.4 min; 2*R*-trans, 32.2 min [Scypinski, Ross 1994].

Ultraviolet Spectrum Aqueous acid (0.1 mol/L hydrochloric acid)—212, 280 nm; aqueous alkali (0.1 mol/L sodium hydroxide)—270 nm.

Infrared Spectrum Principal peaks at wavenumbers 1646, 1490, 1064 cm^{-1} .

Quantification

Blood HPLC Column: Ultrasphere ODS (250 × 4.6 mm i.d., 5 μm). Mobile phase: methanol: 50 mmol/L ammonium acetate (10:90), flow rate 1 mL/min. MS detection (SIM at m/z 212). Retention time: zalcitabine, 8.9 min. Limit of quantification, 0.25 $\mu\text{g/L}$ [Jajoo *et al.* 1992]. Column: phenyl Hypersil NC-04 (250 × 4 mm, i.d., 5 μm). Mobile phase: 1.4 g/L methanol: sodium acetate (pH 6.55), flow rate 1 mL/min. Retention time: 10 min. Limit of detection, 50 $\mu\text{g/L}$ [Frijus-Plessen *et al.* 1990].

Plasma GC-MS Limit of quantification, 2 $\mu\text{g/L}$ [Rubio *et al.* 1988].

HPLC MS detection. Limit of quantification, 0.2 $\mu\text{g/L}$ [Bazunga *et al.* 1998].

Serum HPLC UV detection ($\lambda=250$ nm). Limit of detection, 440 $\mu\text{g/L}$ [Simon *et al.* 2001].

Urine HPLC See Blood. Limit of quantification, 5 $\mu\text{g/L}$ [Bazunga *et al.* 1998].

Cell Suspensions HPLC See Blood [Frijus-Plessen *et al.* 1990].

Perfusate HPLC See Blood [Frijus-Plessen *et al.* 1990].

Disposition in the Body Zalcitabine is well absorbed from the gastrointestinal tract. Absorption shows interindividual variation and the rate of absorption is decreased by administration with food. Peak plasma concentrations in the fasting state are achieved in about 1 to 2 h. The cerebrospinal fluid concentration of the drug is 9 to 37% of those in plasma. The drug is phosphorylated intracellularly to an active antiviral triphosphate for HIV-reverse transcriptase. The metabolites have been identified primarily as dideoxyuridine (ddU). The drug does not appear to undergo any substantial hepatic metabolism. Renal excretion is the primary route of elimination (75% excreted in urine after an IV dose, 60 to 70% after an oral dose). Approximately 10% of an orally administered dose appears in faeces, comprised primarily of unchanged drug and ddU. Accumulation is negligible.

Therapeutic Concentration

Five individuals were fasted overnight and administered 0.75 mg zalcitabine orally, followed by a further 2 h fasting. Peak plasma concentrations reached 17.27, 16.95 and 12.50 $\mu\text{g/L}$ at 1.3, 1.58 and 1.22 h, respectively [Bazunga *et al.* 1998].

One hundred HIV-infected patients with CD4^+ cell counts between 50 and 301 cells/ mm^3 , mean age 31.4 years, were administered 0.75 mg zalcitabine three times a day plus 200 mg zidovudine three times a day for 24 weeks. The mean peak zalcitabine concentration was 5.31 $\mu\text{g/L}$ after 1.75 h [Vanhoove *et al.* 1997].

Toxicity Use of zalcitabine has been associated with significant clinical adverse reactions, some of which are potentially fatal. However, there have been no reports of acute overdose associated with high zalcitabine doses (over 1.5 mg/kg).

Bioavailability Adults: >80%. Children: 29 to 100%. Reduced by 14% with food.

Half-life Adults: 1 to 3 h; children: 0.8 h. Prolonged in patients with renal impairment, up to 8.5 h (with creatinine clearance <55 mL/min).

Volume of Distribution Adults: 0.54 L/kg; children: 9.3 L/ m^3 .

Clearance Adults: total mean clearance, 285 mL/min (range, 165 to 447); mean plasma clearance, 227 mL/min/ m^2 . Children: mean plasma clearance, 149 mL/min/ m^2 .

Protein Binding <4%.

Dose 0.75 mg. Dose may be reduced in patients with renal and hepatic impairment.

Zaleplon

Hypnotic, Pyrazolopyrimidine, Sedative

$\text{C}_{17}\text{H}_{15}\text{N}_5\text{O} = 305.3$

CAS—151319-34-5

IUPAC Name *N*-[3-(3-Cyanopyrazolo[5,1-*b*]pyrimidin-7-yl)phenyl]-*N*-ethylacetamide

Synonyms CL-284846; *N*-[3-(3-Cyanopyrazolo[1,5-*a*]pyrimidin-7-yl)phenyl]-*N*-ethylacetamide; *N*-[3-(9-cyano-2,6,7-triazabicyclo[4.3.0]nona-2,4,7,9-tetraen-5-yl)phenyl]-*N*-ethyl-ethanamide.

Proprietary Name Sonata

Chemical Properties White to off-white powder. Mp 186° to 187°. Sparingly soluble in ethanol and propylene glycol; practically insoluble in water. Log *P* (octanol/water), 2.47 [Wishart 2006], 1.23 [O'Neil *et al.* 2006]. Extraction yield (chlorobutane), +1 [Demme *et al.* 2005]. There were no stability related problems during routine analysis for pharmacokinetic, bioavailability or bioequivalence studies in human plasma [Zhang *et al.* 2006].

Ultraviolet Spectrum Aqueous acid—230, 289, 335 nm.

Mass Spectrum Principal ions at m/z 248, 305, 263, 262, 43, 249, 306, 219.

Quantification

Blood GC Column: J & W DB-5 5% phenylmethylsilicone fused capillary (15 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 100° for 1 min to 200° at 30°/min to 300° at 15°/min for 6 min. NPD. Limit of quantification, 0.5 mg/L [Moore *et al.* 2003].

GC-MS Column: Cross-linked DB-35 fused silica capillary (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 1.5 mL/min. Temperature programme: 120° for 1 min to 320° at 15°/min for 4 min. EI ionisation at 70 eV, SIM acquisition mode, full scan mode. Limit of quantification, 10 $\mu\text{g/L}$; limit of detection, <5 $\mu\text{g/L}$ [Gunnar *et al.* 2006].

LC-MS Column: Chrompack Inertsil ODS-3 (150 × 2.0 mm i.d., 3 μm). Mobile phase: acetonitrile: 1 mmol/L ammonium formate (pH 4.0; 10:90 for 2 min to 60:40 at 15 min for 3 min to 10:90 in 1 min), flow rate 200 μL/min. API, SIM acquisition mode. Limit of quantification, 1 μg/L [Giroud *et al.* 2003].

Plasma HPLC Column: Beckman C₈ reversed phase (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: water (25:75), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{\text{ex}} = 345 \text{ nm}$, $\lambda_{\text{em}} = 460 \text{ nm}$). Limit of quantification, 0.5 μg/L [Beer *et al.* 1994].

LC-MS Column: Shim-pack VP-ODS C₁₈ (250 × 2.0 mm i.d., 5 μm). Mobile phase: methanol: water (70:30), flow rate 0.2 mL/min. APCI, positive ion mode, SIM acquisition mode. Limit of quantification, 0.2 μg/L; limit of detection, 0.1 μg/L [Zhang *et al.* 2006]. Column: Phenomenex Luna C₈(2) (250 × 4.6 mm i.d.). Mobile phase: methanol: water (75:25). Limit of quantification, 0.1 μg/L [Feng *et al.* 2003].

Urine LC-MS Positive ion mode, MRM acquisition mode. Limit of detection, 15 μg/L [Nordgren *et al.* 2005]. Column: LiChrospher RP 8 (125 × 4 mm i.d., 5 μm). Mobile phase: acetonitrile: 50 mmol/L ammonium acetate (10:90 for 10 min to 20:80 at 13 min for 10 min to 45:55 at 25 min), flow rate 1 mL/min. ESI, positive ion mode. UV detection ($\lambda = 245 \text{ nm}$). Limit of detection not reported [Horstkotter *et al.* 2003].

CE Column: Fused silica capillary (total/effective length 27/20 cm, 50 μm i.d.). Fluorescence detection ($\lambda_{\text{ex}} = 325 \text{ nm}$, $\lambda_{\text{em}} = 425 \text{ nm}$). Limit of quantification, 10 μg/L for zaleplon and *N*-desethylzaleplon, 100 μg/L for 5-oxozaleplon and 5-oxo-*N*-desethylzaleplon [Horstkotter *et al.* 2003].

Oral Fluid LC-MS Column: Xterra MS C₁₈ (100 × 2.1 mm i.d., 3.5 μm). Mobile phase: acetonitrile: 0.1% formic acid (5:95 to 80:20 at 10 min), flow rate 200 μL/min. API, positive ion mode. Limit of quantification, 0.1 μg/L [Kintz *et al.* 2005].

Hair LC-MS Column: XTerra MS C₁₈ (100 × 2.1 mm i.d., 3.5 μm). Mobile phase: acetonitrile: 1% formic acid (5:95 to 80:20 at 10 min). API, positive ion mode. Limit of quantification, 1 pg/mg [Villain *et al.* 2005].

Disposition in the Body Zaleplon is rapidly absorbed from the gastrointestinal tract but undergoes significant first-pass hepatic metabolism. Plasma concentrations are usually reached in approximately 1 h and increase linearly with dose. A heavy meal or one with a high fat content delays absorption and reduces peak concentrations. It is metabolised primarily by aldehyde oxidase to form 5-oxozaleplon and, to a lesser extent, by CYP3A4 to *N*-desethylzaleplon, which is further metabolised by aldehyde oxidase to 5-oxo-*N*-desethylzaleplon. About 70% of a dose is excreted in urine as these inactive metabolites or their glucuronides; less than 1% is excreted unchanged. About 17% of a dose is eliminated in the faeces, mainly as 5-oxozaleplon. Zaleplon is distributed into breast milk.

Therapeutic Concentration

Seventeen healthy subjects (mean age 25 years) were administered a single 10 mg oral dose of zaleplon. Mean peak plasma concentration was 37.1 μg/L after 45 min [Sanchez Garcia *et al.* 2000].

Five healthy non-pregnant lactating mothers aged 18 to 35 years old were administered 10 mg zaleplon following an overnight fast of at least 8 h. Venous blood and milk samples were obtained just before and at 1, 2, 3, 4, 6 and 8 h after dose administration. Mean peak plasma concentration for the 5 subjects was 28.7 μg/L and peak breast milk concentration reached 14.0 μg/L, both after 1.2 h. The mean peak plasma concentration for 5-oxozaleplon was 71.7 μg/L after 1.4 h [Darwish *et al.* 1999].

Ten healthy subjects (5 men and 5 women; aged 23 to 31 years) with no history of sleeping disorder were administered 10 and 20 mg oral doses of zaleplon after an overnight fast, with a wash-out period between doses. Peak plasma concentration (C_{max}) and time to peak concentration (t_{max}) were reported:

	Blood zaleplon	
	Arterial	Venous
10 mg dose		
C_{max} (μg/L)	31.8	27.1
t_{max} (min)	78.4	84.5
20 mg dose		
C_{max} (μg/L)	81.7	61.0
t_{max} (min)	46.6	55.5

[Drover *et al.* 2000].

Healthy male volunteers were assigned to receive single oral doses of 1, 5, 15, 30 or 60 mg zaleplon or placebo in a randomised, double-blind study. The following pharmacokinetic values were measured:

Dose (mg)	C_{max} (ng/mL [SD])	t_{max} (h [SD])	AUC (ng•h/mL [SD])	$t_{1/2}$ (h [SD])
1	3.1 (1.0)	0.9 (0.2)	5.9 (2.1)	1.1 (0.2)
5*	10.0 (3.5)	1.0 (0.0)	20.3 (4.7)	0.9 (0.2)
15	27.3 (13.3)	1.2 (0.8)	59.4 (25.6)	1.0 (0.2)
30	71.2 (26.2)	0.9 (0.2)	171.8 (53.1)	1.0 (0.1)
60	109.0 (40.4)	1.5 (1.0)	259.3 (76.4)	1.1 (0.2)

$n = 5$ unless otherwise specified; *4 subjects. [Beer *et al.* 1994].

Toxicity

A 41-year-old Caucasian woman was found lying on her floor dead surrounded by multiple empty pill vials. No medical history was available except that she had been prescribed alprazolam, zaleplon, and butalbital at various different times. Zaleplon was found at the following concentrations: blood, 2.2 mg/L; bile 8.6 mg/L, and urine 1.4 mg/L. The blood zaleplon concentration was around 40 times greater than normal therapeutic levels. Promethazine and butalbital were also found in blood at 0.8 and 9.9 mg/L, respectively [Moore *et al.* 2003].

A 20-year-old man involved in a two-car collision was observed to be very unsteady on his feet. He also had slow movements and reactions, poor co-ordination, lack of balance, and poor attention. He admitted inhaling 3 crushed 10 mg zaleplon tablets and ingesting another three. The time of inhalation and ingestion were not determined. Blood was drawn approx. 1 h after the accident. The following blood concentrations were reported: zaleplon, 0.13 mg/L, chlorphenamine, 0.03 mg/L, dextromethorphan, 0.08 mg/L. No alcohol was detected [Stillwell 2003].

Bioavailability Approximately 30%.

Clearance Approximately 3.5 L/min.

Half-life Approximately 1 h.

Volume of Distribution Approximately 1.4 L/kg.

Protein Binding Approximately 60%.

Dose Usual dose is 10 mg before bed although occasionally patients may require 20 mg. Elderly or debilitated patients and those with mild to moderate hepatic impairment should be given 5 mg. When taking cimetidine concomitantly, it is recommended that the dose of zaleplon be reduced to 5 mg.

Zanamivir

Antiviral

$C_{12}H_{20}N_4O_7 = 332.31$

CAS—139110-80-8

IUPAC Name (2*R*,3*R*,4*S*)-3-Acetamido-4-(diaminomethylideneamino)-2-[(1*S*,2*S*)-1,2,3-trihydroxypropyl]-3,4-dihydro-2*H*-pyran-6-carboxylic acid

Synonyms 5-(Acetylamino)-4-[(aminoiminomethyl)amino]-2,6-anhydro-3,4,5-trideoxy-D-galactero-D-galacto-non-2-enonic acid; GG-167; GR-121167X.

Proprietary Name Relenza

Chemical Properties A white to off-white powder which is soluble in water (18 g/L at 20°).

Ultraviolet Spectrum Principal peak at 238 nm.

Mass Spectrum Principal ions at m/z 60, 167, 121, 197, 180, 151, 214, 274.

Quantification

Serum HPLC MS-MS detection (m/z 333 to 60). Limit of detection, 10 $\mu\text{g/L}$ [Allen *et al.* 1999]. Column: ODS Hypersil (100 \times 4.6 mm i.d.). Mobile phase: acetonitrile:0.05 mol/L Tris-HCl buffer (pH 8.5, 20:80), flow rate 1 mL/min. Fluorescent detection ($\lambda_{\text{ex}}=325$ nm; $\lambda_{\text{em}}=442$ nm). Retention time: not specified. Limit of quantification, 10 $\mu\text{g/L}$ [Stubbs, Harker 1995].

URINE HPLC Column: Nucleosil-Diol (250 \times 4.6 mm, 7 μm). Mobile phase: 20 mmol/L phosphate (pH 2.5) : acetonitrile (18 : 82), flow rate 2.0 mL/min. UV detection ($\lambda=238$ nm). Retention time 17 min. Limit of quantification, 300 $\mu\text{g/L}$ [Morris *et al.* 1995].

Disposition in the Body Zanamivir is not well absorbed. Systemic absorption is between 10 and 20% after an inhaled dose. It does not undergo extensive metabolism or biotransformation, and no metabolites have been detected in humans. The unchanged drug is excreted in urine with 90% of a dose being detected within 24 h. Unabsorbed drug has been detected in faeces.

Therapeutic Concentration

Ninety-two healthy male volunteers and 12 females, aged 18 to 45 years, were administered with the following: 16 mg zanamivir, single doses, IV over a period of 20 to 30 min; 600 mg IV as a single dose and repeated doses; 500 mg, single oral dose; and 16 mg administered daily for five days as separate studies. The single 16 mg IV dose generated mean maximum plasma concentrations of 1.28 (range, 1.14 to 1.47) mg/L at 0.32 h. For the single 600 mg dose concentrations reached 32.76 mg/L at 0.5 h. Steady-state concentrations were observed with the repeated dosing, and the maximum concentration was 39.71 mg/L at 0.5 h on day 5. After the single intranasal dose, the maximum serum concentration was 0.042 (0.020 to 0.054) mg/L

observed within 1.8 (0.75 to 3.0) h. For the repeated dosing, concentration was 0.086 (0.039 to 0.107) mg/L at 0.5 to 3.0 h. The steady-state concentration was 0.071 mg/L. For the oral dose, the maximum concentration was 0.057 to 0.500 mg/L observed at 4 (0.75 to 8.0) h [Cass *et al.* 1999].

Bioavailability 1 to 5% after oral administration.

Half-life Serum half-life, 2.5 to 5.1 h.

Volume of Distribution 16 L; decreases in patients with renal impairment (13.4 L in those with severe impairment; 15.1 L for mild-moderate impairment).

Clearance Total serum clearance, 6.07 to 7.22 (mean, 6.67) L/h; decreases in patients with renal impairment.

Protein Binding <10%.

Dose 10 mg daily.

Zearalenone

Oestrogenic Mycotoxin

$\text{C}_{18}\text{H}_{22}\text{O}_5 = 318.4$

CAS—17924-92-4

IUPAC Name (2E,11S)-15,17-Dihydroxy-11-methyl-12-oxabicyclo[12.4.0]octa-deca1(14),2,15,17-tetraene-7,13-dione

Synonyms Compound F-2; FES; 6-(10-hydroxy-6-oxo-*trans*-1-undecenyl)- β -resorcylic acid lactone; *trans*-zearalenone.

Chemical Properties An oestrogenic mycotoxin produced by *Fusarium graminearum* and other *Fusarium* spp and also by some *Aspergillus* spp. Crystals. Mp 164° to 165°. Soluble in aqueous alkali, ether, benzene and alcohols. Practically insoluble in water [O'Neil *et al.* 2006].

Thin-layer Chromatography Plates: RP-18 and KC-18. Solvent systems: (A) methanol : water; (B) acetonitrile : water; (C) tetrahydrofuran : water. Location reagents: 4-(*p*-nitrobenzyl)pyridine for trichothecenes; UV ($\lambda=365$ nm) for aflatoxins, ochratoxin A, citrinin; aluminium trichloride for sterigmatocystin; Azoene Fast Violet B for zearalenone; 3-methyl-2-benzthiazolinone hydrazone hydrochloride for patulin and penicillic acid. Solvent composition and R_f values reported as follows:

Sweet Pepper. Mobile phase: variable mixtures of water and methanol, 1% acetic acid and 5 mmol/L ammonium acetate. ESI, positive ion

mode. Limit of detection, 0.32–42.48 $\mu\text{g/kg}$ for zearalenone and other mycotoxins [Monbaliu *et al.* 2009]. Beers. Ultra-HPLC Limit of quantification, <0.5 $\mu\text{g/L}$ for zearalenone and other mycotoxins [Romero-Gonzalez *et al.* 2009]. Rat Serum. MRM acquisition mode [Shin *et al.* 2009a]. Cereal-based Food (maize, flour, porridge, beer, pasta). Zearalenone, deoxynivalenol and their major masked metabolites [Vendl *et al.* 2009]. Bovine Milk. Ultra-HPLC. Column: Waters Acquity BEH C_{18} . ESI, MRM acquisition mode, negative ion mode. Limit of quantification, 0.05–0.2 $\mu\text{g/L}$, limit of detection, 0.01–0.05 $\mu\text{g/L}$ for zearalenone and other resorcylic acid lactones [Xia *et al.* 2009]. Wheat Field Drainage Water and River Water. Zearalenone and deoxynivalenol [Bucheli *et al.* 2008]. Beer. ESI. Zearalenone and oestrogenic compounds. Limit of detection, 1.3 $\mu\text{g/L}$ for zearalenone [Maragou *et al.* 2008]. Bovine Urine. Zearalenone and other resorcylic acid lactones and stilbenes [Schmidt *et al.* 2008]. Food (peanuts, pistachios, wheat, maize, cornflakes, raisins, figs). Column: reversed phase. Mobile phase: acetonitrile: water. ESI, MRM acquisition mode, positive ion mode. Limit of quantification, 10–200 $\mu\text{g/kg}$ for zearalenone and 32 other mycotoxins [Spanjer *et al.* 2008]. Aqueous Environmental Samples (drainage water, river water, wastewater treatment plant effluent). Limit of detection, 0.4–12.4 ng/L for zearalenone and other oestrogenic mycotoxins [Hartmann *et al.* 2007]. Maize. Column: reversed phase. Mobile phase: methanol: water containing 0.5% acetic acid and 1 mmol/L ammonium acetate. ESI. Limit of detection, 0.3–4.2 $\mu\text{g/kg}$ for zearalenone and other mycotoxins [Lattanzio *et al.* 2007]. Plant Extract of *Arabidopsis thaliana*. Zearalenone metabolites [Berthiller *et al.* 2006]. Cellulose Filters and Fungal Cultures. Column: C_{18} reversed phase SunFire. Mobile phase: variable mixtures of 10 mmol/L ammonium acetate and 20 $\mu\text{mol/L}$ sodium acetate in water and in methanol. ESI, MRM acquisition mode. Limit of detection, 0.009–50 $\mu\text{g/L}$ for filter samples and 0.04–75 $\mu\text{g/L}$ for fungal culture samples [Delmulle *et al.* 2006]. Horse Plasma, Urine and Faeces. APCI. Limit of quantification, 0.5–1.0 $\mu\text{g/L}$ or 0.5–1.0 $\mu\text{g/kg}$, limit of detection, 0.1–0.5 $\mu\text{g/L}$ or 0.1–0.5 $\mu\text{g/kg}$ for zearalenone and its metabolites [Songsersakul *et al.* 2006]. Maize, Wheat, Cornflakes and Biscuits. Column: Zorbax Eclipse XDB- C_{18} (150 \times 2.1 mm i.d., 3.5 μm). Mobile phase: 10 mmol/L ammonium acetate: methanol (90:10 to 0:100 in 40 min), flow rate 200 $\mu\text{L/min}$. APCI. Limit of detection, 0.1–6.1 ng/g for zearalenone and other mycotoxins [Tanaka *et al.* 2006]. Cereals and Cereal-based Foods. ESI. Limit of detection, 0.3–5 $\mu\text{g/kg}$ for zearalenone and trichothecenes [Klötzl *et al.* 2006]. Maize. APCI. Limit of detection, 0.3–3.8 $\mu\text{g/kg}$ for zearalenone and trichothecenes [Berthiller *et al.* 2006]. Cereals and Cereal-based Food. Column: SB-RP18-Zorbax (150 \times 3.0 mm i.d., 3.5 μm). Mobile phase: methanol: water (30:70 to 100:0 in 8 min), flow rate 250 $\mu\text{L/min}$. ESI, negative and positive ion mode, MRM acquisition mode. Retention time: 13.6 min. Limit of quantification, 0.02–10 ppb [Biselli, Hummert 2005]. Maize Meal. Column: C_{18} . Mobile phase: methanol: water-10 mmol/L formate buffer (pH 3.8). Limit of detection, 2 to 14 $\mu\text{g/kg}$ for zearalenone and most other *Fusarium* mycotoxins [Cavaliere *et al.* 2005]. Bovine Milk. Column: Hypersil ENV or Luna C_{18} . Positive ion mode. Limit of detection, 0.020–0.15 $\mu\text{g/L}$ for zearalenone and 17 other mycotoxins [Sorensen, Elbaek 2005]. Fungal Liquid Cultures, Maize Grain, Insect Larvae, Pig Serum. Limit of detection, 8 ppb for zearalenone, deoxynivalenol and 15-acetyl-deoxynivalenol [Bily *et al.* 2004]. Bovine Urine. ESI. Zearalenone and related mycotoxins and zearanol and taleranol. Limit of detection, 15 $\mu\text{g/L}$ for zearalenone and 2 related mycotoxins [Launay *et al.* 2004]. Fish Tissue. Mobile phase: acetonitrile: methanol: water. ESI or APCI. Limit of detection, 0.1–1.0 ng/g for zearalenone, α -zearalenol and β -zearalenol [Lagana *et al.* 2003]. Sewage Treatment Plant Samples. Column: reversed-phase. APCI, negative ion mode. Zearalenone and anabolic macrocyclic lactones. Limit of detection, ng/L range for zearalenone [Lagana *et al.* 2001]. Beer. APCI, negative ion mode. Limit of quantification, 0.07–0.15 $\mu\text{g/L}$, limit of detection, 0.03–0.06 $\mu\text{g/L}$ for zearalenone and its metabolites [Zöllner *et al.* 2000]. Grains. APCI, negative ion mode. Limit of quantification, 1 $\mu\text{g/kg}$, limit of detection, 0.5 $\mu\text{g/kg}$ [Zöllner *et al.* 1999]. Food and Feed. Column: C_{18} . Mobile phase: acetonitrile: water (40:60), flow rate 1 mL/min. APCI. Comparison with HPLC fluorescence detection [Rosenberg *et al.* 1998].

CE Grains. Zearalenone and its metabolites. Limit of detection, 0.0084 mg/L for zearalenone [Zeng *et al.* 2003].

Note For a review of analytical methods for the analysis of oestrogenic mycotoxins in cereals, see Krska, Josephs [2001]; for a review of the analysis of mycotoxins and its quality assurance, see Krska *et al.* [2005]. For an LC-MS method for the determination of 90 major mycotoxins and other secondary fungal metabolites in cereals, see Berthiller *et al.* [2007]; for a review of LC-MS methods of mycotoxin analysis in biological and food matrices, see Zöllner, Mayer-Helm [2006]; for the determination of 39 mycotoxins in wheat and maize by LC-MS, see Sulyok *et al.* [2006]; for the development of an extraction method using less organic solvents for the LC-MS determination of zearalenone in maize, see Pallaroni, von Holst [2004] and for the influence of extraction parameters such as temperature and solvent extraction mixture, see Pallaroni, von Holst [2003]; for the development of an accelerated extraction method for the LC-MS determination of zearalenone in wheat, see Royer *et al.* [2004]. For an HPLC screening method for mycotoxins, see Kuronen [1989]. For the development of a one-step immunochromatographic strip test for the detection of zearalenone and ochratoxin A in maize, see Shim *et al.* [2009a] and for the development of a gold nanoparticle immunochromatographic assay for the detection of zearalenone in maize, see Shim *et al.* [2009b]. For a fluorescence polarization immunoassay for the detection of zearalenone in maize, see Chun *et al.* [2009]; for an ELISA assay for the detection of zearalenone in cereals, see Thongrussamee *et al.* [2008].

Disposition in the Body Zearalenone is metabolised *in vitro* and *in vivo* its main metabolites α -zearalenol and β -zearalenol [Kolf-Clauw *et al.* 2008].

In goats, zearalenone given as a single IV injection was excreted in urine and faeces as unchanged compound, and its metabolites, α - and β -zearalenol, were excreted mainly as glucuronide and/or sulfate conjugates, with the β -metabolite being the predominant form [Dong *et al.* 2010].

In pigs fed zearalenone-contaminated oats, urine samples showed that 60% of zearalenone was transformed to α - and β -zearalenol (in ratio of 3 : 1). Trace amounts of zearanol and taleranol were also found in urine. Liver samples contained mainly α -zearalenol with small amounts of β -zearalenol and zearalenone; the ratio of α -/ β -zearalenol was 2.5 : 1. In both urine and liver, α - and β -zearalenol were mainly in the form of glucuronide conjugates [Zöllner *et al.* 2002].

After IV administration of zearalenone to rats, minimal quantities were excreted unchanged in urine (0.5%) and bile (0.9%) [Shin *et al.* 2009b].

In rats, steady-state blood levels of zearalenone after oral doses of 0.1 mg/kg daily were predicted to be 0.014 μ g/L. A daily oral dose in humans to achieve this blood level was determined to be 0.0312 mg/kg daily [Shin *et al.* 2009c]. In rats, zearalenone is rapidly absorbed after oral administration, but absolute oral bioavailability is low.

Toxicity The α -reduced metabolites of zearalenone are activated forms, but β -reduced metabolites are less oestrogenic than zearalenone [Kolf-Clauw *et al.* 2008].

The LD₅₀ (oral) is 500 mg/kg in mice [Ouanes *et al.* 2003] and >10 g/kg in rats [Baldwin *et al.* 1983].

Note For a review of the toxicology of mycotoxins including zearalenone, see He, Xu [2005] and Paterson, Lima [2010]; for other reviews of mycotoxin toxicology and potential effects on humans, see Pestka, Smolinski [2005], Rotter *et al.* [1996] and Sudakin [2003].

Half-life Distribution half-life 3.15 h and elimination half-life 28.58 h (in goats, both after IV administration) [Dong *et al.* 2010].

Bioavailability Absolute oral bioavailability in rats 2.7% [Shin *et al.* 2009b].

Volume of Distribution In rats after IV administration, 2–4.7 L/kg [Shin *et al.* 2009b].

Clearance In rats after IV administration, 5.0–6.6 L/h/kg [Shin *et al.* 2009b].

Dose For a report of the mycotoxin content of UK organic and conventional oats, see Edwards [2009]. It has been reported that *Fusarium* toxins were used as an agent of biological/chemical warfare ("yellow rain") [Mirocha *et al.* 1983; Rosen, Rosen 1982; Stark 2005].

Zeranol

Anabolic Steroid (Veterinary), Oestrogen

C₁₈H₂₆O₅ = 322.4

CAS—26538-44-3

IUPAC Name (7R,11S)-7,15,17-Trihydroxy-11-methyl-12-oxabicyclo[12.4.0]octadeca-1(14),15,17-trien-13-one

Synonyms (3S,7R)-3,4,5,6,7,8,9,10,11,12-Decahydro-7,14,16-trihydroxy-3-methyl-1H-2-benzoxacyclotetradecin-1-one; 6-(6-(10-dihydroxyundecyl)-β-resorcylic acid μ-lactone; MK-188; P-1496; THFES (HM); α-zearalanol.

Proprietary Names Ralabol; Ralgro; Ralone.

Chemical Properties Crystals. Mp 182° to 183°. Log *P* (octanol/water), 3.86 [Meylan, Howard 1995]. Zeranol was stable for 14 days at 4°, in LC mobile phase for 4 days at 4°, and in milk brought to boiling [Scott, Lawrence 1988].

Ultraviolet Spectrum Methanol—218, 263, 303 nm.

Mass Spectrum Principal ions at *m/z* 73, 433, 307, 335, 434, 312, 74, 295 (TMS derivative).

Quantification

Plasma HPLC Column: LiChrosorb RP-8 reversed-phase (250 × 3.0 mm i.d., 10.0 μm). Mobile phase: methanol:acetonitrile:water (125:205:250), flow rate 1.75 mL/min. Fluorescence detection (λ_{ex} = 236 nm, λ_{em} = 418 nm). Limit of detection, 0.6 μg/L [Trenholm *et al.* 1981].

Urine GC-MS Column: J & W DB-1 methylsilicone capillary (15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 100° for 1 min to 220° at 16°/min to 301° at 3.8°/min for 5.5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection not reported [Ayotte *et al.* 1996].

Milk LC Column: Waters Guard-PAK precolumn module with Resolve C₁₈ precolumn insert (255 × 4.6 mm i.d., 5.0 μm). Mobile phase: methanol:water:acetonitrile (61:35:4), flow rate 1.2 mL/min. Fluorescence detection (λ_{ex} = 236 nm, λ_{em} = 470 nm). Limit of detection, 2 μg/mL [Scott, Lawrence 1988].

Other GC-MS Bovine Muscle. Column: HP-5MS capillary (30 m × 250 μm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 120° to 280° at 30°/min for 9 min. EI ionisation, SIM acquisition mode. Limit of quantification, 1.0 μg/kg; limit of detection, 0.5 μg/kg [Zhang *et al.* 2006].

HPLC Hand Gauze Patches. Column: octadecylsiloxane C₁₈. Mobile phase: methanol:water (60:40), flow rate 2 mL/min. UV detection (λ = 236 nm). Limit of quantification, 20 μg/L; limit of detection, 7 μg/L. Fluorescence detection (λ_{ex} = 236 nm, λ_{em} = 418 nm). Limit of quantification, 150 μg/L; limit of detection, 50 μg/L [Neumeister 1987].

LC-MS Chicken and Rabbit Liver. Column: Waters Xtetra C₁₈ (50 × 2.1 mm i.d., 5.0 μm). Mobile phase: acetonitrile:20 mmol/L ammonium acetate. ESI, negative ion mode, MRM acquisition mode. Limit of quantification, 1 μg/kg [Fang *et al.* 2002]. Bovine Muscle and Liver. Column: Zorbax Eclipse XDB-C₁₈ (150 × 2.1 mm i.d., 5.0 μm). Mobile phase: 0.005% acetic acid:acetonitrile (60:40), flow rate 0.2 mL/min. ESI, negative ion mode, SIM acquisition mode. Limit of detection, 0.5 μg/kg [Hori, Nakazawa 2000].

Disposition in the Body Zeranol is rapidly metabolised to zearalanone, the main active metabolite. Approximately 55% of a dose is excreted in urine, with less than 1% as free zeranol and free zearalanone compared with 19% and 13% of their respective conjugates.

Therapeutic Concentration

Six healthy volunteers were each administered a single tablet containing 75 mg [³H] zeranol (corresponding to an average dosage of 1.23 mg/kg). A maximum blood concentration of 0.32 mg/L was reached after 1 h [Migdalof *et al.* 1983].

Half-life Approximately 22 h (for [³H]zeranol).

Zidovudine

Antiviral

$C_{10}H_{13}N_5O_4 = 267.2$

CAS—30516-87-1

IUPAC Name 1-[4-Azido-5-(hydroxymethyl)oxolan-2-yl]-5-methylpyrimidine-2,4-dione

Synonyms Azidodeoxythymidine; 3'-azido-3'-deoxythymidine; azidothymidine; AZT; BW-A509U; BW-509U; compound-S; zidovudinum.

Proprietary Names Combivir; Novo-AZT; Retrovir.

Chemical Properties A white to yellowish or brownish odourless crystalline powder. Mp 124°. Sparingly soluble in water, freely soluble in alcohol and soluble in dehydrated alcohol. pK_a 9.68; 3'-azido-3'-deoxy-5'- β -D-glucopyranuronosyl (GZDV), 3.5. Log *P* (octanol/water), 0.05.

Gas Chromatography Column: 3% OV-1 Chromosorb WHP 80/100 mesh (4 inch \times 1/4 inch). Temperature: 280°. Carrier gas: N_2 , flow rate 32 mL/min. Detection: flame ionisation. Retention index: 2307 [Mills, Roberson 1993].

High Performance Liquid Chromatography System HAD—*k* 6.60.

Column: Novapak phenyl (150 \times 3.9 mm i.d., 4 μ m). Mobile phase: isopropanol: 20 mmol/L, pH 5 sodium citrate (2.5:97.5), flow rate 1 mL/min. UV detection ($\lambda=250$ nm). Retention time: 22.4 min [Rosell-Rovira *et al.* 1996].

Ultraviolet Spectrum Aqueous acid—207, 266 nm; basic—266 nm.

Infrared Spectrum Principal peaks at wavenumbers 2077, 1675, 1084 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 142, 126, 127, 80, 54, 42, 55, 69.

Quantification

Blood HPLC Column: Ultrasphere ODS (75 \times 4.6 mm, 3 μ m). Mobile phase: phosphoric acid (pH 6.55):MeCN (95:5 to 70:30 over 7 min, to 20:80 over 1.5 min, return to initial ratio over 1 min), flow rate 1 mL/min. IS: G-AZT. UV detection ($\lambda=266$). Retention time: zidovudine, 3.6 min; IS, 5.0 min. Limit of detection, 7 μ g/L, limit of quantification, 22 μ g/L [Nadal *et al.* 1996].

Plasma HPLC Limit of detection, 10 μ g/L [Aymard *et al.* 2000]. Column: RPC₁₈ Novapak (300 \times 3 mm, i.d., 4 μ m). Mobile phase: methanol:tetrahydrofuran: 0.025 mol/L potassium phosphate (pH 3.1, 3.7:2.8:93.5), flow rate 1.0 mL/min. UV detection ($\lambda=270$ nm). Retention time: zidovudine, 16.8 min; metabolite GZDV, 11.7 min. Limit of quantification, 20 μ g/L for zidovudine, 10 μ g/L for the 5'-glucuronyl form, GZDV [Schrive, Plasse 1994].

Serum HPLC UV detection ($\lambda=250$ nm). Limit of detection, 30 μ g/L [Simon *et al.* 2001]. MS-MS detection. Limit of detection, 2.5 μ g/L [Kenney *et al.* 2000]. Limit of detection, 0.05 mg/L [Nebinger, Koel 1994].

Urine HPLC See Plasma [Schrive, Plasse 1994].

Disposition in the Body Zidovudine is rapidly absorbed from the gastrointestinal tract (66 to 70%), although absorption is delayed if the drug is administered with food. It undergoes extensive first-pass metabolism in the liver where ~40% of the oral dose is lost. Metabolism of zidovudine by the kidney is minimal but rapid metabolism occurs intracellularly in the liver to GZDV. Two other hepatic metabolites have been identified, 3'-amino-3'-deoxythymidine (AMT), and its 5'-*O*-glucuronide derivative GAMT. 5'-glucuronide is the major metabolite in plasma and urine accounting for 50 to 80% of an administered dose. Metabolism of zidovudine to AMT occurs in the liver and gastrointestinal microsomes. Zidovudine is highly lipophilic and is widely distributed. It concentrates in the semen where it may exhibit delayed clearance compared to serum. It is excreted in urine as the unchanged drug and its metabolite (63 to 95%), via both glomerular filtration and tubular secretion. After an oral dose, 72 to 74% is excreted as the metabolite and 14 to 18% as unchanged drug. After IV administration, 45 to 60% is excreted as metabolite and 18 to 29% as the unchanged drug. There is no evidence that zidovudine accumulates in plasma or tissues. There is significant penetration into CNS, with a CNS: plasma ratio of about 0.5.

Therapeutic Concentration The trough serum therapeutic concentration range is 0.1 to 0.3 mg/L and peak, 1.0 to 1.5 mg/L.

Thirteen HIV-positive asymptomatic adults with an average age of 33.1 years were administered 300 mg zidovudine after an 8 h fast. These individuals did not have CD4 cell counts ≤ 200 cells/mm³. The mean peak zidovudine concentration was 1.64 mg/L at 0.52 h and the peak GZDV concentration 9.41 mg/L at 0.71 h [Wang *et al.* 1999].

Eleven HIV-positive, asymptomatic men (average age, 37.4 years, and with CD4 cell counts ≥ 300 cells/mm³) were administered 200 mg zidovudine every 8 h for 4 days. Mean peak zidovudine concentrations were 0.714, 0.594 and 0.394 mg/L for three separate dosing regimens (with washout periods of ~9 days), observed at 0.9, 0.9 and 1.8 h, respectively. Peak GZDV concentrations were 4.655, 3.346 and 2.508 mg/L at 1.0, 1.2 and 1.7 h, respectively for the three dose intervals [Cato *et al.* 1998].

One-hundred HIV-infected patients with CD4 cell counts between 50 and 301 cells/mm³, mean age 31.4 years, were administered 0.75 mg zalcitabine three times a day, plus 200 mg zidovudine three times a day for 24 weeks. The mean weekly peak zidovudine concentration was 347 μ g/L after 1.29 h [Vanhove *et al.* 1997].

Toxicity The serum toxic concentration range is 0.5 to 3 mg/L.

A 34-year-old man with AIDS took a hundred 200 mg tablets of zidovudine with temazepam, after 6 h he experienced symptoms of drowsiness. The blood levels of zidovudine were 185 μ mol/L and 5'-glucuronide, 114 μ mol/L [Hargreaves *et al.* 1988].

A 20-year-old man took an entire month's supply of zidovudine 2 h before presentation. His blood pressure was 90/40 mmHg, and he had tachycardia of 140 bpm. Serum levels 2 h after the overdose were 339.43 μ mol/L (zidovudine) and 565.51 μ mol/L (G-AZT); after 12 h, 0.33 μ mol/L (zidovudine) and 0.88 μ mol/L (G-AZT); after 24 h, <0.05 μ mol/L (zidovudine) and <0.13 μ mol/L (G-AZT) [Valentine *et al.* 1993].

A 26-year-old male with AIDS ingested 110 to 220 mg/kg zidovudine and unknown amounts of phenobarbital and triazolam. 8 h after ingestion, the man experienced headache and nausea, although the vital signs were normal. 7.75 h after administration, serum levels were 23.82 mg/L (zidovudine) and 89.39 mg/L (G-AZT); after 8.75 h, serum levels were 9.18 mg/L (zidovudine)

and 64.29 mg/L (G-AZT); after 9.75 h, serum levels were 9.18 mg/L (zidovudine) and 26.60 mg/L (G-AZT); after 16 h, serum levels were 0.12 mg/L (zidovudine) and 0.47 mg/L (G-AZT) [Spear *et al.* 1988].

Bioavailability 60 to 70%. This value is erratic in HIV-positive individuals.

Half-life Zidovudine, 0.9 to 1 h; AMT, 2.7 h; GZDV, 1.6 h.

Volume of Distribution Adults (at steady state): 1.4 to 1.6 L/kg, apparent 3.0 L/kg. Children (at steady state): 22 to 64 L/m².

Clearance Adults: total body clearance, 22 to 27 mL/min/kg; plasma clearance, 1.3 L/h/kg. Children: mean total body clearance, 30.9 mL/min/kg. Reduced clearance in hepatic and renal impairment.

Protein Binding 34 to 38% (predominately to albumin); 20% plasma.

Dose Adults: oral dose, 500 to 1200 mg daily; IV dose, 1 to 2 mg/kg/dose. Children: oral dose, maximum 200 mg; IV dose, 100 mg/m²/dose.

Infrared Spectrum Principal peaks at wavenumbers 815, 1492, 699, 953, 1075, 840 cm⁻¹ (KBr disk).

Mass Spectrum Principal ions at *m/z* 58, 70, 318, 316, 317, 193, 319, 161.

Quantification

Plasma GC Column: 3% OV-17 Supelcoport 80/100 mesh (2 m × 2 mm i.d.). Carrier gas: N₂, 30 mL/min. Temperature: 255°. Retention time: 3.4 min. Limit of detection, 10 μg/L [Högberg *et al.* 1979].

GC-MS Column: 3% OV-17 on GasChrom Q 80/100 mesh (2 m × 2 mm i.d.). Carrier gas: Ar: CH₄, 60 mL/min. ECD. Limit of detection, 5 μg/L [Caillé *et al.* 1983].

HPLC Column: Nucleosil C₁₈ (100 × 3 or 4 mm i.d., 5 μm). Mobile phase: phosphate buffer (pH 2.0): acetonitrile (91:9), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 1.5 for zimeldine and 0.7 μg/L for norzimeldine [Westerlund, Erixson 1979]. Column: μBondapak-CN (300 × 3.9 mm i.d., 10 μm). Mobile phase: acetonitrile: methanol: phosphate buffer (pH 7.0, 625:155:220), flow rate 1.5 mL/min. Limit of detection, 5 μg/L [Visser *et al.* 1984].

Disposition in the Body Zimeldine is readily absorbed after oral administration and rapidly demethylated by first-pass metabolism to norzimeldine, which is active. Other metabolites include zimeldine N'-oxide and 3-(4-bromophenyl)-3-(3-pyridyl)acrylic acid; very little unchanged drug is excreted in the urine.

Therapeutic Concentration

Following a single oral dose of 100 mg to 10 subjects, peak plasma zimeldine concentrations of 0.048–0.164 mg/L (mean 0.10 mg/L) were attained in 2–3 h and peak plasma norzimeldine concentrations of 0.012–0.092 mg/L (mean 0.04 mg/L) were attained in 1.5–8 h [Caillé *et al.* 1983].

Following oral doses averaging 225 mg daily, given twice a day to 8 subjects, steady-state plasma concentrations of 0.029–0.102 mg/L (mean 0.07 mg/L) zimeldine and 0.145–0.554 mg/L (mean 0.25 mg/L) norzimeldine were reported. The corresponding steady-state concentrations in CSF were 0.003–0.007 mg/L (mean 0.006 mg/L) and 0.027–0.072 mg/L (mean 0.043 mg/L) for zimeldine and norzimeldine, respectively [Calil *et al.* 1982].

Toxicity Zimeldine has been withdrawn from use because of potentially severe neurological side-effects [Montgomery *et al.* 1989]. Recovery within 48 h of ingestion of 3 g zimeldine together with half a bottle of vodka has been reported.

The following postmortem tissue distribution was reported in a female subject who had been receiving 300 mg zimeldine daily and had been found drowned: zimeldine 0.3 mg/L and norzimeldine 0.9 mg/L in blood, zimeldine 5.0 mg/L and norzimeldine 15 mg/L in bile, and zimeldine 4.0 μg/g and norzimeldine 16 μg/g in liver [Geyer 1981].

A 30-year-old woman who was undergoing psychiatric treatment died from a self-inflicted gunshot wound. However, zimeldine concentrations exceeded the normal therapeutic levels (ranging from 0.02–0.25 mg/L). It was known that she was being treated with 100 mg twice daily and other drugs. The postmortem blood concentrations were 0.71 mg/L for zimeldine and 2.2 mg/L for norzimeldine. Zimeldine was also detected at a concentration of 24 μg/g in liver, 1.5 mg/L in urine, 0.77 μg/g in brain tissue and 0.77 μg/g in bile, a total of 3.8 mg/L. Norzimeldine was detected at concentrations of 8.2 mg/kg, 11 mg/L, 3.7 mg/kg and 16 mg/L, respectively [Semple 1984].

A 35-year-old woman attempted suicide by ingesting 5 g zimeldine at 9 a.m. Her plasma zimeldine concentrations were 747, 1985 and 433 μg/L, respectively, at 2, 6 and 12 h later [Anseau *et al.* 1985].

Bioavailability 20–50%

Half-life Plasma half-life, zimeldine ~4–9 h; norzimeldine ~15–25 h.

Volume of Distribution Zimeldine, ~4 L/kg; norzimeldine, ~9 L/kg.

Zimeldine

Antidepressant, Selective Serotonin Reuptake Inhibitor (SSRI)

C₁₆H₁₇BrN₂ = 317.2

CAS—56775-88-3

IUPAC Name 3-(4-Bromophenyl)-N,N-dimethyl-3-pyridin-3-ylprop-2-en-1-amine

Note Zimeldine was previously known as zimelidine.

Chemical Properties A white crystalline solid. pK_a 3.8, 8.6. Log P (octanol/water), 3.18.

Zimeldine Hydrochloride

C₁₆H₁₇BrN₂·2HCl·H₂O = 408.2

CAS—60525-15-7 (anhydrous); 61129-30-4 (monohydrate).

Proprietary Names *Normud*; *Zelmid*.

Chemical Properties A white to yellowish-white crystalline substance. Mp 193°. Soluble 1 in less than 1 of water and 1 in 1000 of ethanol; practically insoluble in chloroform and ether.

Colour Tests Cyanogen bromide (30 s)—red; Liebermann's reagent—brown.

Thin-layer Chromatography System TA—R_f 0.47; system TB—R_f 0.27; system TC—R_f 0.25; system TE—R_f 0.48; system TAE—R_f 0.20. (Dragendorff spray—positive; location under ultraviolet light—violet fluorescence).

Gas Chromatography System GA—zimeldine RI 2270, M (nor-) RI 2223; system GM—zimeldine RRT 0.820, M (nor-) RRT 0.941 (both relative to iprindole).

High Performance Liquid Chromatography System HA—zimeldine k 3.2 (trailing peak), M (nor-) k 2.9 (trailing peak); system HF—k 0.67; system HY—RI 270.

Ultraviolet Spectrum Aqueous acid—250 nm (A₁¹ = 630a); aqueous alkali—258 nm.

Clearance Plasma clearance, zimeldine ~7–11 mL/min/kg; norzimeldine ~8 mL/min/kg.

Protein Binding ~90% for zimeldine; ~80% for norzimeldine.

Note For a review of the pharmacokinetics of zimeldine see Heel *et al.* [1982].

Dose Zimeldine hydrochloride has been given in doses of 100 to 300 mg daily.

Ziprasidone

Atypical Antipsychotic

C₂₁H₂₁ClN₄O₅ = 412.9

CAS—146939-27-7

IUPAC Name 5-[2-[4-(1,2-Benzothiazol-3-yl)piperazin-1-yl]ethyl]-6-chloro-1,3-dihydroindol-2-one

Synonym CP-88059

Proprietary Names Geodon; Zeldox.

Chemical Properties White to off white powder. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Ziprasidone Hydrochloride Monohydrate

C₂₁H₂₄Cl₂N₄O₂S = 467.4

CAS—138982-67-9

Synonym

CP-88059-1

Quantification

Blood LC-MS Column: Zorbax Stable Bond Cyano (50 × 2.1 mm i.d., 3.5 μm). Mobile phase: methanol-acetonitrile-20 mmol/L ammonium formate buffer (pH 4, 2: 8: 90): methanol-acetonitrile-20 mmol/L ammonium formate buffer (pH 4, 24: 36: 40, 80: 20 to 20: 80 in 4.5 min for 2.5 min to 80: 20 for 2.5 min). TIS, MRM acquisition mode. Retention time: 5.0 min. Limit of detection, 0.8 μg/L [Roman *et al.* 2008].

Plasma HPLC Limit of quantification, 10 μg/L [Schlotterbeck *et al.* 2009]. Column: Lichrospher 60 RP-Select B. Mobile phase: acetonitrile: water (40: 60) containing 0.01 mol/L SDS and 0.5% glacial acetic acid. UV detection (λ=245 nm). Limit of quantification, 10 μg/L [Mauri *et al.* 2007]. Column: Supelcosil LC-1 (250 × 4.6 mm i.d., 5 μm). Mobile phase: 0.05 mol/L monobasic potassium phosphate: acetonitrile: *o*-phosphoric acid: *n*-butylamine (720: 280: 1.0: 1.2), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex}=320 nm, λ_{em}=410 nm). Retention time: 6.6 min. Limit of quantification, 0.5 μg/L [Suckow *et al.* 2004].

LC-MS Column: Luna C₁₈ (50 × 4.6 mm i.d., 5 μm). Mobile phase: 0.65 mmol/L aqueous ammonium acetate: methanol: acetonitrile (10: 45: 45), flow rate 0.6 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.25 μg/L [Aravagiri *et al.* 2007].

Serum HPLC Column: Hypersil ODS C₁₈ (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: water: tetramethylethylenediamine (50: 49.6: 0.4, pH 6.5), flow rate 1.0 mL/min. UV detection (λ=254 nm). Retention time: 12 min. Limit of quantification, 10 μg/L [Sachse *et al.* 2005]. Column: Supelco, LC-18 DB (250 × 2.1 mm i.d.). Mobile phase: water: acetonitrile: trifluoroacetic acid: TEA (600: 300: 0.45: 0.72), flow rate 0.27 mL/min. UV detection (λ=215 nm). Retention time: 9.22–9.74 min. Limit of quantification, 0.5–50 μg/L [Janiszewski *et al.* 1995].

LC-MS Column: C₁₈ (50 × 4.6 mm i.d., 5 μm). Mobile phase: methanol: 5 mmol/L acetic acid (pH 3.9, 20: 80 to 70: 30 over 4 min for 1 min), flow rate

1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 1.87 μg/L [Kirchherr, Kühn-Velten 2006]. Limit of quantification, 0.5 μg/L [Prakash *et al.* 1997a].

Milk HPLC See Plasma [Schlotterbeck *et al.* 2009].

Other HPLC Human Liver Microsomes. Column: YMC basic (150 × 4.6 mm i.d., 3 μm). Mobile phase: 10 mmol/L ammonium acetate (pH 5.0): methanol, flow rate 1.0 mL/min. ESI. Retention time: ~40 min. Limit of detection not reported [Miao *et al.* 2005]. Rat Urine. Column: YMC basic (250 × 4.6 mm i.d., 5 μm). Mobile phase: 20 mmol/L ammonium acetate (pH 5.00): methanol (90: 10 for 10 min to 20: 80 over 50 min for 7 min to 90: 10 over 8 min. Limit of detection not reported [Prakash *et al.* 1997b].

Disposition in the Body Ziprasidone is rapidly absorbed and extensively metabolised by *N*-dealkylation, oxidation, reductive cleavage, hydration and *N*-dearylation. Twelve metabolites have been identified in urine and serum; the major ones in urine are oxindole acetic acid and its glucuronide conjugate, benzisothiazole-3-yl-piperazine (BITP), BITP sulfoxide, BITP sulfone and its lactam, ziprasidone sulfoxide, and ziprasidone sulfone (the major metabolites in serum). Other metabolites include *S*-methyl-dihydroziprasidone, *S*-methyl-dihydroziprasidone sulfoxide and 6-chloro-5-(2-piperazin-1-yl-ethyl)-1,3-dihydro-indol-2-one. After 10 days of treatment with ziprasidone, approx. 20% of an administered dose is excreted in urine, with only a small proportion as the unchanged drug. In patients with mild to moderate impairment of liver function, the serum concentrations were 30% higher than in normal patients. No significant differences in the pharmacokinetics of ziprasidone have been observed in patients with impaired renal function. Less than a third of the clearance of ziprasidone is mediated by P450 CYP isoforms but CYP3A4 appears to be the main isoform involved, leading to interactions with the classic inhibitor ketoconazole [Trenton *et al.* 2003].

Therapeutic Concentration

Four healthy male volunteers were fasted overnight and administered a 20 mg suspension of ziprasidone after a standard breakfast for 11 days. The mean peak plasma concentration was 45.4 μg/L (range 28.8–62.0 μg/L) for the 4 subjects which was observed at ~3.5 h (range 2–6 h) [Prakash *et al.* 1997a].

Thirty-nine healthy males, 18 to 45 years of age, were administered fixed doses of 10, 40, 40 escalated to 80, and 40 escalated to 120 mg daily. For all doses, a dose of 20 mg was administered on day 1 and a 48 h wash-out period allowed. On subsequent days, the dose was administered twice daily and escalated to 80 mg or 120 mg on days 7 and 10, respectively. The peak plasma concentrations on day 1 were 12.2, 26.6, 60.0 and 34.3 μg/L for the 4 dosing regimens, respectively, observed at 5.0, 4.8, 3.8 and 4.0 h, respectively. On day 18, the peak plasma concentrations were 14.8, 44.6, 118.6 and 139.4 μg/L for the 10, 40, 80 and 120 mg doses, respectively, observed at 5.2, 3.8, 3.7 and 4.7 h [Miceli *et al.* 2000].

Sixty-seven patients treated with 40 to 280 mg ziprasidone for at least 7 days reached a median steady-state serum concentration of 76 μg/L. A concentration of 40–130 μg/L may be considered the recommended target plasma concentration [Sachse *et al.* 2005].

Thirteen schizophrenic patients were administered doses of 80–160 mg/day ziprasidone for 8 weeks. Plasma concentrations ranged from 16–160 μg/L with a mean of 75.8 ± 51 μg/L. No correlation was found between the oral dose and plasma concentrations [Mauri *et al.* 2007].

Toxicity Common clinical effects following ziprasidone overdose are drowsiness and tachycardia [Klein-Schwartz *et al.* 2007]. Ziprasidone is widely reported to cause QTc prolongation, which in one patient has been associated with torsades de pointes [Manini *et al.* 2007]. Ziprasidone has been associated with instances of pathological laughing when used for drug-induced psychosis in Parkinson's disease [Schindehütte, Trenkwalder 2007], neuroleptic malignant syndrome [Ozen *et al.* 2007] and tardive dyskinesia [Sinha *et al.* 2007]. For a review of exposures, see Forrester [2008] or LoVecchio *et al.* [2005]. For overdose, see Burton *et al.* [2000], Fasano *et al.* [2009], Gómez-Criado *et al.* [2005], House [2002], Insa Gómez, Gutierrez [2005], Prieto *et al.* [2005] and MacVane, Baumann [2009].

Half-life Normally 4 h but is increased by ~2 h in patients with mild to moderately impaired liver function.

Bioavailability Oral, 60% [MacVane, Baumann 2009].

Milk: plasma ratio 0.06 [Schlotterbeck *et al.* 2009].

Protein Binding 99% [Trenton *et al.* 2003].

Aravagiri M *et al.* (2007). Determination of ziprasidone in human plasma by liquid chromatography–electrospray tandem mass spectrometry and its application to plasma level determination in schizophrenia patients. *J Chromatogr B Analyt Technol Biomed Life Sci* 847: 237–244.

Zolmitriptan

5-HT₁ Receptor Agonist, Antimigraine

C₁₆H₂₁N₃O₂ = 287.4

CAS—139264-17-8

IUPAC Name (4S)-4-[[3-(2-Dimethylaminoethyl)-1H-indol-5-yl]methyl]-1,3-oxazolidin-2-one

Synonym 311C90

Proprietary Name Zomig

Chemical Properties A white to almost white crystalline powder. Mp 139° to 141°. Readily soluble in water. pK_a 9.6.

High Performance Liquid Chromatography System HZ—retention time 1.8 min.

Ultraviolet Spectrum Principal peaks at 225, 301 nm.

Infrared Spectrum

Mass Spectrum Principal ions at *m/z* 182, 288, 167, 156, 165, 243, 183, 157.

Quantification

Plasma HPLC MS–MS detection. Limit of detection, 0.1 µg/L [Seaber *et al.* 1998]. UV detection (λ=230 nm). Limit of detection, 2 µg/L [Seaber *et al.* 1997].

Serum HPLC Column: silica Alltech (150 × 2.1 mm i.d., 5 µm). Mobile phase: 20 mmol/L ammonium acetate (pH 4); formic acid: methanol: acetonitrile (80:10:10) (pH 2.7). Detection: MS–MS. Retention time: 2.95 min. Limit of detection, 0.1 µg/L [Vishwanathan *et al.* 2000].

Urine HPLC See Plasma. Limit of detection, 100 µg/L [Seaber *et al.* 1997].

Disposition in the Body Zolmitriptan is absorbed after oral administration, which is unaffected by food. There is extensive hepatic metabolism, principally to the indole acetic acid, and also the *N*-oxide and *N*-desmethyl analogues. The *N*-desmethyl metabolite is more active than the parent compound in animal studies. Metabolism is primarily mediated by CYP1A2, and monoamine oxidase is responsible for further metabolism of the *N*-desmethyl metabolite. At least 60% of the dose is excreted in urine, mainly as the indole acetic acid. Approximately 30% is excreted in faeces, mainly as the unchanged drug. There is no evidence of accumulation on multiple dosing.

Therapeutic Concentration

Twenty-four normal individuals, 12 aged between 18 and 39 years, and 12 aged from 65 to 76 years old, were fasted overnight and administered zolmitriptan (5, 10 and 15 mg doses). The peak plasma drug concentrations for the young individuals were 9.1, 18.9 and 23.3 µg/L for the three respective doses. The group aged from 65 to 76 years showed peak zolmitriptan concentrations of 9.9, 18.6 and 22.7 µg/L for the respective doses [Peck *et al.* 1998].

Twenty healthy individuals (average age of 23 years) were administered a single oral dose of 2.5 mg and the equivalent IV dosage. Peak drug concentrations were observed within the hour and were sustained for 6 h at levels of 3.3 µg/L (for men), and 3.8 µg/L (for women). For the IV doses, the females and males produced peak concentrations of 5.8 and 10.6 µg/L, respectively, when administered 2.5 mg [Seaber *et al.* 1998].

Toxicity Doses of 50 mg result in sedation. Other side effects include transient increase in blood pressure, myalgia, and muscle weakness.

Bioavailability 40 to 50%.

Half-life 2.5 to 3 h, prolonged in patients with hepatic impairment.

Volume of Distribution About 7.0 L/kg.

Clearance Total plasma clearance, about 31.5 mL/min/kg.

Protein Binding 25%.

Dose The usual dose is 2.5 mg with a maximum dose of 15 mg in 24 h.

Zolpidem

Hypnotic

C₁₉H₂₁N₃O = 307.4

CAS—82626-48-0

IUPAC Name *N,N*-Dimethyl-2-[6-methyl-2-(4-methylphenyl)imidazo[1,2-*a*]pyridin-3-yl]acetamide

Synonyms SL-80.0750; *N,N*-6-trimethyl-2-(4-methylphenyl)imidazo[1,2-*a*]pyridine-3-acetamide.

Chemical Properties Mp 196°. Insoluble in water. pK_a 6.2. Log *P* (octanol/water) 3.85. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Zolpidem Tartrate

(C₁₉H₂₁N₃O)₂·C₄H₆O₆ = 764.9

CAS—99294-93-6

IUPAC Name (2*R*,3*R*)-2,3-Dihydroxybutanedioic acid; *N,N*-dimethyl-2-[6-methyl-2-(4-methylphenyl)imidazo[1,2-*a*]pyridin-3-yl]acetamide

Synonyms SL-80.0750-23N; zolpidem hemitartrate.

Proprietary Names *Ambien*; *Bikalim*; *Cedrol*; *Eduar*; *Ivadal*; *Niotal*; *Stilnoct*; *Stilnox*; *Tovalt*.

Chemical Properties A white or almost white hygroscopic crystalline powder. Mp 193° to 197°. It is slightly soluble in water (23 g/L at 20°); practically insoluble in dichloromethane; sparingly soluble in methanol.

Gas Chromatography System GB—RI 2941; system GT—RI 2715.

Column: Ultra 2 5% phenyl methyl silicone fused silica capillary (25 m × 0.32 mm i.d., 0.52 μm). Carrier gas: He, 2.1 mL/min. Temperature programme: 210° to 285° at 2.5°/min. IS: prazepam. ECD/NPD. Retention time: 1.2 min for zolpidem, 1 min for IS [Gaillard *et al.* 1993].

High Performance Liquid Chromatography System HY—RI 291; system HZ—RT 3.2 min; system HAA—RT 11.9 min.

Column: μBondapak C₁₈ (300 × 3.9 mm i.d.). Mobile phase: acetonitrile: 50 mmol/L potassium dihydrogen phosphate (50:50), flow rate 1.5 mL/min. IS: propylzolpidem. Fluorescence detection (λ_{ex} = 254 nm, λ_{em} = 390 nm). Retention time: 3.10 min for zolpidem, 4.75 min for IS [Durolo, Greenblatt 1997].

Ultraviolet Spectrum Aqueous acid (pH 2.6)—207 nm; (methanol)—243, 314 nm; (0.1 mol/L hydrochloric acid)—236, 294 nm; (0.2 mol/L sulfuric acid)—237, 295 nm; (0.025 mol/L sulfuric acid)—238, 294.5 nm; (0.1 mol/L ammonium formate, pH 3)—238, 296 nm; aqueous alkali (0.1 mol/L sodium hydroxide)—242 nm.

Infrared Spectrum Principal peaks at wavenumbers 1637, 1402, 1511, 1136 cm⁻¹ (zolpidem tartarate); KBr pellet).

Mass Spectrum Principal ions at *m/z* 235, 307, 219, 92, 65, 42, 115, 102.

Quantification

Blood GC-MS SIM acquisition mode [Rohrig *et al.* 2010]. EI ionisation, full scan mode. Comparison with ELISA [Reidy *et al.* 2008]. Column: DB 35MS (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 1.5 mL/min. Temperature programme: 120° for 1 min to 330° at 15°/min for 2.8 min. EI ionisation at 70 eV. Retention time: 15.12 min. Limit of quantification, 30 μg/L, limit of detection, 1.5 μg/L [Gunnar *et al.* 2005]. Column: DB-35 MS (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 1.5 mL/min. Temperature programme: 120° for 1 min to 320° at 15°/min for 4 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 25 μg/L, limit of detection, <10 μg/L [Gunnar *et al.* 2004]. Column: HP-5 MS 95% dimethyl polysiloxane, 5% diphenylpolysiloxane (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 280° for 6.5 min to 320° at 20°/min for 1.5 min. MSD, SIM acquisition mode. Retention time: 5.28 min. Limit of detection not reported [Keller *et al.* 1999].

HPLC Fluorescence detection (λ = 254 nm). Limit of detection, 10 μg/L [Guinebault *et al.* 1986].

LC-MS Column: Varian Pursuit 3 C₁₈ (100 × 3 mm i.d., 3 μm). Mobile phase: methanol: ammonium formate. MRM acquisition mode, positive ion mode. Limit of quantification, 0.0005–0.01 mg/kg for zolpidem and other drugs of abuse and metabolites [Bjork *et al.* 2010]. Zolpidem, zopiclone and benzodiazepines [Deveaux *et al.* 2008]. Column: XTerra MS C₁₈. Mobile phase: methanol: formate buffer. MRM acquisition mode. Limit of quantification, 1–2 μg/L for zolpidem, zopiclone, benzodiazepines and metabolites [Laloup *et al.* 2005]. Column: Inertsil ODS-3 (150 × 2.0 mm i.d., 3 μm). Mobile phase: 1 mmol/L ammonium formate buffer: acetonitrile (90:10 for 2 min to 40:60 in 15 min for 3 min to 90:10 in 1 min. APCI, positive ion mode, SIM acquisition mode. Limit of detection, 0.1 μg/L [Giroud *et al.* 2003].

Plasma GC Column: OV-1 fused silica (25 m × 0.32 mm i.d., 0.2 μm). Temperature: 235°. Carrier gas: He, 1.3 mL/min. IS: clonazepam. NPD. Retention time: 10.02 min for zolpidem, 10.72 min for IS, limit of detection, 1 μg/L for zolpidem and 2 μg/L for zopiclone [Stanke *et al.* 1996]. Column: Ultra 2 (5% phenylmethylsiloxane). NPD and ECD. Zolpidem and benzodiazepines. Limit of detection, 10 μg/L for zolpidem [Gaillard *et al.* 1993].

HPLC Column: YMC-Pack C₁₈ (150 × 4.6 mm i.d., 5 μm). Mobile phase: 20 mmol/L phosphate buffer (pH 3): acetonitrile (73:27), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 320 nm, λ_{em} = 388 nm). Limit of quantification, 1.8 μg/L [Nirogi *et al.* 2006]. Column: Shiseido Capcell PAK UG C₁₈ (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: 0.05 mol/L potassium phosphate (pH 6.0, 4:6). IS: trazodone. Fluorescence detection (λ_{ex} = 254 nm, λ_{em} = 400 nm). Retention time: 4.6 min for zolpidem, 5.3 min for IS. Limit of quantification, 1 μg/L [Ring, Bostick 2000]. Column: Nucleosil 100-3 C₁₈ (150 × 4.6 mm i.d.).

Temperature programme: 35°. Mobile phase: methanol:30 mmol/L potassium dihydrogen phosphate (pH 6.8):TEA (30:69:1), flow rate 0.7 mL/min. Fluorescence detection (λ_{ex} = 244 nm, λ_{em} = 388 nm). Retention time: 4.7 min. Limit of quantification, 1.5 µg/L [Ptáček *et al.* 1997]. Column: Nova-Pak C₁₈ (300 × 3.9 mm i.d., 4 µm). Temperature: 30°. Mobile phase: methanol:tetrahydrofuran:phosphate buffer (pH 2.6, 65:5:30), flow rate 0.8 mL/min. DAD (λ = 210 nm). Retention time: 4.66 min. Limit of detection, ~24 µg/L [Tracqui *et al.* 1993a]. Column: Supelcosil LC₁₈-DB (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile:0.05 mol/L phosphate buffer (pH 6.0, 60:40) containing 0.75% methanol, flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 254 nm, λ_{em} = 390 nm). Limit of detection, 0.2 µg/L [Ascalone *et al.* 1992]. See Blood [Guinebault *et al.* 1986].

LC-MS Column: Acquity UPLC BEH C₁₈ (100 × 2.1 mm i.d., 1.7 µm). Mobile phase: 0.05% formic acid in water: 0.05% formic acid in acetonitrile (75:25 for 5 min to 70:30 at 6 min to 59.5:40.5 at 9.5 min to 10:90 at 13 min to 75:25 at 17 min), flow rate 0.4 mL/min. SIR acquisition mode. Retention time: 1.56 min. Limit of detection, 0.2–8 µg/L for zopiclone, zolpidem, benzodiazepines and metabolites [Ishida *et al.* 2009]. Column: C₈ reversed phase (50 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile:10 mmol/L ammonium acetate (pH 4.6, 80:20), flow rate 0.7 mL/min. ESI, SRM acquisition mode. Limit of quantification, 2.5 µg/L [Bhatt *et al.* 2006]. Column: Merck LiChroCART with Superspher 60 RP Select B stationary phase. Mobile phase: ammonium formate:acetonitrile. APCI. Zolpidem and benzodiazepines and related drugs [Kratzsch *et al.* 2004].

Serum GC Column: DB 5 (5 m × 0.32 mm i.d., 0.17 µm). Carrier gas: N₂, 50 cm/s. Temperature: 230°. NSD. Limit of quantification, 5 µg/L for zopiclone and zolpidem [Debruyne *et al.* 1991].

Urine GC-MS Column: HP-1 (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 150° for 1 min to 310° at 30°/min for 3 min. SIM acquisition mode. Limit of detection, 2 µg/L for zolpidem carboxylic acid [Lewis, Vine 2007]. Limit of detection, <100 µg/L [Bickeboeller-Friedrich, Maurer 2001]. See Blood [Keller *et al.* 1999; Reidy *et al.* 2008].

HLPC See Plasma. Limit of detection, 1 µg/L [Ascalone *et al.* 1992].

LC-MS Limit of detection, <0.5 µg/L for zolpidem, zopiclone and benzodiazepines [Deveaux *et al.* 2008]. Column: Waters XTerra MS C₁₈ (150 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile:2 mmol/L ammonium formate (pH 3, 90:10):2 mmol/L ammonium formate (pH 3, 30:70 to 36:64 in 4 min for 4.5 min to 90:10 in 3.5 min to 30:70 in 1.5 min), flow rate 0.2 mL/min. ESI, positive ion mode, SRM acquisition mode. Retention time: 2.8 min. Limit of detection, 0.01 µg/L [Quintela *et al.* 2006]. Column: XTerra MS C₁₈. Mobile phase: methanol:formate buffer. MRM acquisition mode. Limit of quantification, 10–25 µg/L for zolpidem, zopiclone, benzodiazepines and metabolites [Laloup *et al.* 2005]. Column: XTerra MS C₁₈ (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile:formate buffer (5:95 at time 0 to 60:40 at 3 min to 80:20 at 7 min until 10 min to 5:95 at 10.5 min for 9.5 min), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.1 ng/mg, limit of detection, 0.01 µg/L [Villain *et al.* 2004].

Immunoassay EMIT. Limit of detection, 5 µg/L. Comparison with LC-MS [Huynh *et al.* 2009].

Stomach Contents GC-MS See Blood [Keller *et al.* 1999].

Hair LC-MS Column Zorbax SB-Phenyl (100 × 2.1 mm i.d., 3.5 µm). Positive mode ESI. Zolpidem and benzodiazepines and other drugs [Hegstad *et al.* 2008]. Column: XTerra MS C₁₈. Mobile phase: methanol:formate buffer. MRM acquisition mode. Limit of quantification, 0.5–10 ng/g for zolpidem, zopiclone, benzodiazepines and metabolites [Laloup *et al.* 2005]. See Urine [Villain *et al.* 2004].

Disposition in the Body Zolpidem is absorbed after oral administration; bioavailability is ~70%. Peak plasma concentrations are attained within 0.5 and 3 h. It displays linear pharmacokinetics within the therapeutic dose range and undergoes first-pass metabolism by the liver. Metabolic pathways include oxidation and hydroxylation. The inactive metabolites are excreted in urine (56%) and faeces (37%), with <1% excreted as the unchanged drug. It is distributed into breast milk and crosses the placenta. It is not removed by dialysis.

Therapeutic Concentration The therapeutic concentration range in serum is 80–150 µg/L.

Twelve men aged between 23 and 36 years (mean, 28) were administered 10 mg oral zolpidem. The peak concentration observed at 2.6 h was 76 µg/L [Colle *et al.* 1991].

Eighteen male volunteers (average age 26 years) were administered single oral and IV doses of zolpidem. The 12 men who received 20 mg orally showed a mean peak concentration of 55 µg/L at 1.0 h. The remaining men were administered 5 mg IV, and the peak concentration was 244 µg/L at 1.1 h [Patat *et al.* 1994].

In 16 healthy woman (including smokers and some taking oral contraceptives) given 5 mg zolpidem tartrate, maximum serum levels were 60 µg/L. Clearance was higher (445 vs. 345 mL/min) and half-life shorter (1.8 vs. 2.7 h) in smokers than in non-smokers. Those taking oral contraceptives also had higher clearance and a shorter zolpidem half-life [Olubodun *et al.* 2002].

After 5 mg zolpidem, elderly subjects had higher maximum serum levels than younger subjects (93 vs. 40 µg/L) and half-life was also increased in elderly subjects (2.7 vs. 1.5 h) [Olubodun *et al.* 2003].

Toxicity The serum toxic concentration is 500 µg/L.

In a fatality, zolpidem blood concentration was 3.29 mg/L; acepromazine was also detected [Tracqui *et al.* 1993b].

In an analysis of 344 cases of acute overdose with zolpidem, ingested doses ranged from 10–1400 mg. Half the patients had also taken other drugs (psychotropic drugs or alcohol). Signs of intoxication were attributed to zolpidem in 105 cases. Drowsiness occurred at doses of 140–440 mg [Garnier *et al.* 1994].

A 39-year-old man who died after an overdose of zolpidem had levels of 2.91, 1.40 and 2.13 mg/L in heart blood, peripheral blood and urine, respectively. The zolpidem concentration in the liver was 4.74 µg/g and the gastric contents contained a total of 172 mg [Meeker *et al.* 1995].

A 68-year-old woman died after ingesting at least 300 mg zolpidem. Postmortem zolpidem blood concentration was 4.1 mg/L; mebrobamate and carisoprodol were also detected [Winek *et al.* 1996].

In a review of cases of zolpidem poisoning, only mild symptoms were found with ingestion of up to 0.6 g, although 1 anorexic patient became comatose after ingestion of 0.6 g [Wyss *et al.* 1996].

An elderly woman who was found dead in the bath and who had taken up to a possible 60 tablets of 10 mg zolpidem each had blood and urine levels of 7.9 and 4.1 mg/L, respectively. A total of 7 mg of unabsorbed zolpidem was found in the gastric contents. However, death was attributed to drowning and death solely from the zolpidem overdosage was considered an unlikely occurrence [Lichtenwalner, Tully 1997].

Caffeine, risperidone and zolpidem were found in the urine of 36-year-old woman who was found dead. The following postmortem levels of zolpidem were found: 4.6 mg/L in subclavian blood, 7.7 mg/L in iliac blood, 1.6 mg/L in vitreous humour, 8.9 mg/L in bile, 1.2 mg/L in urine, 22.6 mg/L in liver and 42 mg in gastric contents. Serum also contained 5.6 µg/L 9-hydroxyrisperidone. Death was attributed to acute zolpidem overdose [Gock *et al.* 1999].

In a 58-year-old woman who was found dead, zolpidem and carbamazepine were found in the urine. Postmortem zolpidem levels were 1.6 mg/L in iliac blood, 0.52 mg/L in vitreous humour, 2.6 mg/L in bile, 12 mg/L in liver and 0.9 g in gastric contents. Death was attributed to acute zolpidem overdose [Gock *et al.* 1999].

In 8 fatalities where zolpidem was identified at postmortem, zolpidem was found at therapeutic levels in 3. Five deaths were attributed to drug intoxication and in 3 of these, zolpidem was considered an incidental finding. In 2 deaths, zolpidem levels were elevated and considered to contribute to the drug intoxication [Levine *et al.* 1999].

A 23-year-old woman who was a victim of drug-facilitated sexual assault had blood and urine zolpidem levels of 16 and 32 ng/L, respectively, 6 days later. Zolpidem level in hair was 0.75 ng/g [Kintz *et al.* 2005].

In another report of drug-facilitated sexual assault, the blood level of zolpidem 11 h after the last supposed intake was 47 µg/L [Maravelias *et al.* 2009].

For another report of zolpidem intoxication, see [Sadeg *et al.* 1999].

Bioavailability ~70%.

Half-life Plasma half-life, 1.7–2.5 h in normal subjects; increased to ~10 h in patients with cirrhosis.

Volume of Distribution 0.54–0.68 L/kg.

Clearance Plasma clearance, 0.26 L/h/kg.

Protein Binding 92%.

Dose The usual dose is 10 mg, occasionally 15 or 20 mg, but this is associated with increased risk of side-effects. In the elderly, the dose is reduced to 5 mg.

Zomepirac

Analgesic

C₁₅H₁₄ClNO₃ = 291.7

CAS—33369-31-2

IUPAC Name 2-[5-(4-Chlorobenzoyl)-1,4-dimethylpyrrol-2-yl]acetic acid

Synonym 5-(4-Chlorobenzoyl)-1,4-dimethyl-1H-pyrrole-2-acetic acid

Chemical Properties White crystals. Mp 178° to 179°, with decomposition. Log P (octanol/water), 3.21.

Zomepirac Sodium

C₁₅H₁₃ClNNaO₃·2H₂O = 349.7

CAS—64092-48-4 (anhydrous); 64092-49-5 (dihydrate)

Proprietary Names Zomax; Zomaxin; Zopirac.

Chemical Properties A pale yellow crystalline powder. Mp 295° to 296°.

Colour Tests Formaldehyde-sulfuric acid—red; Liebermann's reagent (100°)—orange; Marquis test—yellow→orange (at 100°); sulfuric acid—yellow.

Thin-layer Chromatography System TD—R_f 0.12; system TE—R_f 0.04; system TF—R_f 0.12; system TAE—R_f 0.88; system TAJ—R_f 0.19; system TAK—R_f 0.65; system TAL—R_f 0.88 (Marquis reagent, yellow → green, slow; mercuric chloride-diphenylcarbazone reagent, blue, pink after heating; acidified potassium permanganate solution, positive; Van Urk reagent, positive, red after heating).

Gas Chromatography System GA—zomepirac-ME RI 2343; M (-CO₂) RI 2025.

High Performance Liquid Chromatography System HD—k 3.7; system HY—RI 495.

Ultraviolet Spectrum Aqueous acid 262 (A₁¹=418b), 324 nm (A₁¹=492b); aqueous alkali 261, 330 nm (A₁¹=525a).

Infrared Spectrum Principal peaks at wavenumbers 1587, 1560, 760, 1275, 958, 1493 cm⁻¹ (zomepirac sodium, KBr disk).

Mass Spectrum Principal ions at *m/z* 246, 291, 248, 290, 247, 139, 111, 292.

Quantification

Plasma GC ECD. Limit of detection, 5 µg/L [Ng, Kalbron 1983].

HPLC/UV detection. Limit of detection, 50 µg/L [Welch *et al.* 1982].

Serum HPLC See Plasma [Welch *et al.* 1982].

Urine HPLC UV detection. Limit of detection, about 100 µg/L for zomepirac and zomepirac glucuronide [Pietta, Calatroni 1983].

Disposition in the Body Rapidly and completely absorbed after oral administration. About 90% of a dose is excreted in the urine in 48 h with about 5 to 20% as unchanged drug and about 60 to 80% as a glucuronide conjugate; about 5% of the dose is excreted as a hydroxylated metabolite; 4-chlorobenzoic acid has been reported to be a minor metabolite. <2% of a dose is eliminated in the faeces.

Therapeutic Concentration

After a single oral dose of 100 mg to 21 subjects, peak plasma concentrations averaged 4.7 mg/L at about 1 h; following oral administration of 100 mg four times a day to 10 subjects, steady-state plasma concentrations of about 3 to 4 mg/L were reported [Nayak *et al.* 1980].

Following a single oral dose of 200 mg to 5 subjects, peak plasma concentrations of 4.5 to 11.3 mg/L (mean, 9) were attained in about 1 h; mean peak plasma concentrations of zomepirac glucuronide and hydroxyzomepirac of 3.9 mg/L and 0.2 mg/L, respectively, were attained in 0.5 to 3 h [O'Neill *et al.* 1982].

Toxicity Zomepirac has been withdrawn from use because of reports of allergic anaphylactoid reactions. In a fatality caused by the ingestion of 9 g of zomepirac sodium, a postmortem blood concentration of 152 mg/L and an ante-mortem blood concentration, obtained 9 h prior to death, of 286 mg/L were reported [Backer *et al.* 1983].

Half-life Plasma half-life, about 4 to 10 h.

Distribution in Blood Plasma: whole blood ratio, 1.9.

Protein Binding 98 to 99%.

Note For a review of zomepirac, see Morley *et al.* [1982]; for a review on the acute toxicity of zomepirac, see Joubert [1982].

Dose Zomepirac sodium has been given in doses equivalent to 400 to 600 mg of zomepirac daily.

Zonisamide

Anticonvulsant

C₈H₈N₂O₃S = 212.2

CAS—68291-97-4

IUPAC Name 1,2-Benzoxazol-3-ylmethanesulfonamide

Synonyms AD-810; CI-912; PD-110843

Proprietary Names Excegran; Zonegran.

Chemical Properties White needles. Mp 160° to 163°; also reported as 162° to 166°. Sparingly soluble in water, chloroform, hexane; soluble in methanol, ethanol ethyl acetate and acetic acid. pK_a 9.66 [Kawada *et al.* 2002], 10.2. For the stability of zonisamide in oral suspensions, see Abobo *et al.* [2009].

Quantification

Blood HPLC Column: Develosil ODS-7 (250 × 4.6 mm i.d.). Mobile phase: 1% acetic acid : acetonitrile : isopropylalcohol (70 : 11 : 10), flow rate 1.0 mL/min. UV detection (λ = 285 nm). Limit of detection, 0.1 mg/L [Nishiguchi *et al.* 1992]

Plasma HPLC Column: Supelcosil LC-18 (250 × 4.6 mm i.d., 5 μm). Mobile phase: aqueous 30 mmol/L potassium phosphate buffer (pH 3.7) : acetonitrile (65 : 35), flow rate 1.2 mL/min. UV detection (λ = 270 nm). Retention time: 4.5 min. Limit of quantification, 0.5 mg/L, limit of detection, 0.75 mg/L [Greiner-Sosanko *et al.* 2007a]. Column: μBondapak C₁₈. Mobile phase: aqueous 30 mmol/L potassium phosphate buffer (pH 3.7) : acetonitrile (65 : 35), flow rate 1.2 mL/min. UV detection (λ = 270 nm). Limit of detection, 0.5 mg/L [Greiner-Sosanko *et al.* 2007b]. Column: Luna phenylhexyl (50 × 2.0 mm i.d., 5 μm). Mobile phase: water : dibutylammonium phosphate : methanol (1000 : 1 vial: 100), flow rate 0.5 mL/min. UV detection (λ = 220 nm). Limit of quantification, 5 mg/L [Juenke *et al.* 2006]. Column: Shim-pack CLC-DDS (150 × 6.0 mm i.d.). Mobile phase: water : methanol (70 : 30), flow rate 1.5 mL/min. UV detection (λ = 238 nm). Limit of detection not reported [Kawada *et al.* 2002]. Column: Presto FT-C₁₈ (30 × 4.6 mm i.d., 2 μm). Mobile phase: 10 mmol/L sodium phosphate buffer (pH 7.5) : 10 mmol/L sodium phosphate buffer (pH 7.5) : acetonitrile (60 : 40, 100 : 0 for 3 min to 95 : 5 in 3 min to 0 : 100 in 1 min for 4 min to 100 : 0 in 0.5 min), flow rate 0.5 mL/min. UV detection (λ = 235 nm). Limit of detection, 0.1 mg/L [Nakamura *et al.* 2001]. See also Berry [1990], Shimoyama *et al.* [1999].

LC-MS Column: Shimadzu Shimpack XR-ODS (50 × 4.6 mm i.d., 2.2 μm). Mobile phase: 20 mmol/L acetate buffer (pH 5.6) : acetonitrile-methanol-tetrahydrofuran (61.3 : 32.2 : 6.5; 86 : 14 for 2 min to 77 : 23 at 5 min for 4 min to 64 : 36 at 12 min to 59 : 41 at 16.5 min to 86 : 14 at 17.5 min), flow rate 0.8 mL/min. APCI, SIM acquisition mode. Limit of detection, 0.78 μg/L [Subramanian *et al.* 2008].

Serum HPLC Column: Alltima 3C₁₈ (150 × 4.6 mm i.d.). Mobile phase: methanol : acetonitrile : 25 mmol/L phosphate buffer containing 12.5 mmol/L sodium chloride (14.5 : 19.5 : 66), flow rate 0.9 mL/min. Fluorescence detection (λ_{ex} = 215 nm, λ_{em} = 275 nm). Retention time: 4.45 min. Limit of quantification, 0.027 mg/L, limit of detection, 0.016 mg/L. [Vermeij, Edelbroek 2007]. See Plasma [Juenke *et al.* 2006]. Column: Cadenza CD-C₁₈ (150 × 4.6 mm i.d., 3 μm). Mobile phase: 25 mmol/L potassium phosphate buffer (pH 4.6) : methanol : acetonitrile (65 : 20 : 15), flow rate 1.0 mL/min. UV detection (λ = 235 nm). Limit of quantification, 2.5 mg/L [Yoshida *et al.* 2006]. Column: ODS μBondapak C₁₈ (300 × 3.9 mm i.d., 10 μm). Mobile phase: acetonitrile : methanol : water (17 : 20 : 63). UV detection (λ = 246 nm). Retention time: 3.9 min. Limit of detection, 0.1 mg/L [Furuno *et al.* 1994]. Column: Chemcosorb 5-ODS-UH (150 × 4.6 mm i.d.). Mobile phase: 1% acetic acid : propan-2-ol : acetonitrile (80 : 11 : 10). UV detection (λ = 235 nm). Limit of detection not reported [Hashimoto *et al.* 1994]. Column: Hypersil R ODS (125 × 4.6 mm i.d., 5 μm). Mobile phase: phosphate buffer-acetonitrile (90 : 10) : phosphate buffer-acetonitrile (40 : 60, 85 : 15 for 0.5 min to 55 : 45 at 9.5 min for 3.5 min to 85 : 15 at 15 min), flow rate, 1.2 mL/min. UV detection (λ = 205 nm). Limit of detection, 6 mg/L [Juergens 1987].

CE Running buffer: 50 mmol/L SDS with 10 or 25 mmol/L phosphate (pH 8.0). UV detection (λ = 210 nm). Limit of detection not reported [Pucci, Raggi 2005].

Brain HPLC See Blood. Limit of detection, 0.05 μg/g [Nishiguchi *et al.* 1992].

Breast Milk HPLC See Plasma [Kawada *et al.* 2002]. See Plasma. Mobile phase: potassium dihydrogen phosphate buffer (pH 3.5) : acetonitrile [Shimoyama *et al.* 1999].

Disposition in the Body Zonisamide is rapidly and almost completely absorbed from the gastrointestinal tract following oral administration [Neels *et al.* 2004]. Peak plasma concentrations are achieved within 2–6 h of oral administration; however, steady-state concentrations are not achieved for up to 2 weeks owing to the drug's long half-life. It is metabolised via acetylation to *N*-acetylzonisamide and reduction

mediated by CYP3A4 to 2-sulfamoylacetophenol (SMAP); further glucuronide conjugation also occurs. Excretion is mainly in the urine, 35% as unchanged drug, 15% as *N*-acetylzonisamide and 50% as the glucuronide of SMAP.

Therapeutic Concentration

After single dose oral administration of 200 mg and 800 mg zonisamide to healthy volunteers, peak plasma concentrations were 2.3 and 12.5 mg/L, respectively, reached within 2.4–3.6 h [Peters, Sorkin 1993].

In a study investigating the steady-state pharmacokinetics of zonisamide, 24 healthy volunteers were administered the following drug regimen: 100 mg/day for a week, followed by 200 mg/day for another week and finishing on 400 mg/day until day 35. The volunteers were split into 2 groups: the 11 in group A received their dose divided every 12 h after the first week and the 8 in group B received their entire dose in the morning. Peak plasma concentrations were 30.3 and 23.8 mg/L for group A and group B, reached after 2.1 and 1.8 h, respectively. Steady-state concentrations were 28.3 mg/L for group A and 23.8 mg/L for group B and were reached in an average of 15 days from the last dose adjustment [Kochak *et al.* 1998].

Note For a study of zonisamide pharmacokinetics in epileptic patients, see Hashimoto *et al.* [1994] and patients also taking phenytoin or carbamazepine, see Ojemann *et al.* [1986]

Toxicity Adverse events, most notably drowsiness, loss of appetite, gastrointestinal problems and CNS toxicity have been noted with plasma zonisamide concentrations exceeding 30 mg/L.

Note For a case of zonisamide-induced mania, see Charles *et al.* [1990].

Bioavailability Oral, 100% [Neels *et al.* 2004].

Half-life In plasma, ~63 h.

Volume of Distribution Apparent, 1.45 L/kg.

Clearance Plasma, 0.30–0.35 mL/min/kg.

Distribution Plasma : red blood cells 1 : 8.

Protein Binding 40–60% [Neels *et al.* 2004].

Note For a review of zonisamide and its pharmacodynamic and pharmacokinetic properties and therapeutic potential in epilepsy, see Peters, Sorkin [1993].

Dose Initially, 100 mg once daily orally, increased to 200 mg daily in one or several doses. Doses of up to 600 mg daily have been administered.

Zopiclone

Hypnotic

C₁₇H₁₇ClN₆O₃ = 388.8

CAS—43200-80-2

IUPAC Name [6-(5-Chloropyridin-2-yl)-5-oxo-7H-pyrrolo[3,4-b]pyrazin-7-yl] 4-methylpiperazine-1-carboxylate

Synonyms 4-Methyl-1-piperazine-carboxylic acid 6-(5-chloro-2-pyridinyl)-6,7-dihydro-7-oxo-5H-pyrrolo [3,4-b] pyrazin-5-yl ester; RP-27267.

Proprietary Names Amoban; Datolan; Imovane; Limovan; Rhovane; Siaten; Sopivan; Ximovan; Zileze; Zimovane.

Chemical Properties A white or slightly yellow powder. Mp 178°. It is practically insoluble in water and in alcohol; sparingly soluble in acetone; freely soluble in dichloromethane; dissolves in dilute mineral acids. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

Thin-layer Chromatography System TAE— R_f 0.04; system TB— R_f 0.04; system TE— R_f 0.47; system TF— R_f 0.00.

Gas Chromatography System GB—RI 3263, art (aminochloropyridine) RI 1261; system GT—RI 2950.

High Performance Liquid Chromatography System HX—RI 331; system HY—RI 269; system HZ—RT 2.3 min; system HAX—RT 7.5 min; system HAY—RT 3.8 min.

Column: Symmetry C₈ (150 × 3.9 mm i.d., 5 μm). Mobile phase: 0.05 mol/L ammonium acetate : acetonitrile (70 : 30), flow rate 1.7 mL/min. IS: zopiclone chloride. Fluorescence detection (λ_{ex} = 300 nm, λ_{em} = 470 nm). Retention time not specified [Bramness *et al.* 2001].

Column: Chiralcel OD-H chiral (250 × 4.6 mm i.d., 5 μm). Mobile phase: ethanol : hexane (60 : 40), flow rate 0.6 mL/min. IS: chlordiazepoxide. Fluorescence detection (λ_{ex} = 300 nm, λ_{em} = 470 nm). Retention time: 19 min for (–)-zopiclone, 28 min for (+)-zopiclone and 9.5 min for IS [Foster *et al.* 1994].

Ultraviolet Spectrum Aqueous acid (0.2 mol/L sulfuric acid/methanol)—304 nm; (0.1 mol/L hydrochloric acid)—303 nm; (0.1 mol/L ammonium formate, pH 3)—306, 214 nm; aqueous alkali (0.1 mol/L sodium hydroxide)—237, 277 nm; basic—304 nm.

Infrared Spectrum Principal peaks at wavenumbers 1715, 1372, 1463, 1087 cm⁻¹.

Mass Spectrum Principal ions at m/z 143, 245, 218, 247, 98, 112, 159, 56.

Quantification

Blood GC Column: DB 17 (15 m × 0.2 mm i.d., 0.25 μm). Carrier gas: H₂. Temperature programme: 220° for 5 min to 280° at 10°/min for 11 min. ECD. Limit of quantification, 4 μg/L [Boniface *et al.* 1992].

GC-MS Column: RTX-5MS (15 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 100° for 1.0 min to 300° at 30°/min for 1.33 min. Limit of quantification, 10 μg/L [Rohrig *et al.* 2010]. Column: DB-5HT (30 m × 0.32 mm i.d., 0.10 μm). Carrier gas: H₂, 2.5 mL/min. Temperature programme: 180° for 1 min to 350° at 50°/min. NI and PICI, SIM acquisition mode. Retention time: 3.88 min. Limit of quantification, 10 μg/L [Gunnar *et al.* 2006]. Column: DB-35MS (30 m × 0.2 mm i.d., 0.25 μm). Carrier gas: He, 1.5 mL/min. Temperature programme: 120° for 1 min to 320° at 15°/min for 4 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 10 μg/L, limit of detection, 10 μg/L [Gunnar *et al.* 2004].

LC-MS Column: Varian Pursuit 3 C₁₈ (100 × 3 mm i.d., 3 μm). Mobile phase: methanol : ammonium formate. MRM acquisition mode, positive ion mode. Limit of quantification, 0.010 mg/kg, limit of detection, 0.0003 mg/kg [Bjork *et al.* 2010]. Zopiclone, zolpidem and benzodiazepines [Deveaux *et al.* 2008]. Column: XTerra MS C₁₈ (150 × 2.1 mm i.d., 3.5 μm). Mobile phase: methanol : 0.1% formate buffer (10 : 90 to 50 : 50 over 5 min to 70 : 30 in 20 min to 10 : 90 in 0.1 min for 14.9 min), flow rate 0.2 mL/min. MRM acquisition mode. Limit of quantification, 2 μg/L [Laloup *et al.* 2005].

Plasma GC Column: OV-1 fused silica (25 m × 0.32 mm i.d., 0.2 μm). Temperature: 235°. Carrier gas: He, 1.3 mL/min. NPD. Retention time: 19.59 min. Limit of detection, 2 μg/L for zopiclone and 1 μg/L for zolpidem [Stanke *et al.* 1996]. Column: 5% phenyl methyl silicone (25 m × 0.32 mm i.d., 0.52 μm). Carrier gas: He, 1.8 mL/min. Temperature programme: 210° to 300° at 2.5°/min for 9 min. ECD. Retention time: 11.8 min. Limit of quantification, 2 μg/L [Gaillard *et al.* 1993]. AFID. Limit of detection, 5 μg/L [Kennel *et al.* 1990].

HPLC Column: reversed phase C₁₈. Fluorescence detection (λ_{ex} = 307 nm, λ_{em} = 483 nm). Limit of quantification, 3 μg/L for zopiclone and 6 μg/L for desmethylzopiclone [Nirogi *et al.* 2006]. Column: Daicel OD-H (250 × 4.6 mm i.d.). Mobile phase: heptane : ethanol (2 : 3), flow rate 0.6 mL/min. UV detection (λ = 306 nm). Limit of quantification, 2.5 μg/L for zopiclone enantiomers [Gebauer, Alderman 2002]. Column: Nova-Pak C₁₈ (300 × 3.9 mm i.d., 4 μm). Mobile phase: methanol : tetrahydrofuran : phosphate buffer (pH 2.6, 65 : 5 : 30), flow rate 0.8 mL/min. DAD (λ = 210 nm). *k* value 0.56. Retention time: 4.05 min. Limit of detection, ~25 μg/L [Tracqui *et al.* 1993]. Column: Ultrasphere ODS C₁₈ (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : methanol : tetrahydrofuran : TMA (pH 2.5, 15 : 5 : 2 : 78), flow rate 1.0 mL/min. UV detection (λ = 305 nm). Limit of detection, 5 μg/L [Royer-Morrot *et al.* 1992]. Fluorescence detection (λ_{ex} = 300 nm, λ_{em} = 470 nm). Limit of detection, 5 μg/L for zopiclone enantiomers [Fernandez *et al.* 1993]. See Urine [Le Liboux *et al.* 1987]. See also Miller *et al.* [1986] and Stanley *et al.* [1985].

LC-MS Column: Acquity UPLC BEH C₁₈ (100 × 2.1 mm i.d., 1.7 μm). Mobile phase: 0.05% formic acid in water : 0.05% formic acid in acetonitrile (75 : 25 for 0.5 min to 70 : 30 at 6 min to 59.5 : 40.5 at 9.5 min to 10 : 90 at 13 min to 75 : 25 at 17 min), flow rate 0.4 mL/min. SIR acquisition mode. Retention time: 1.04 min. Limit of detection, 0.2–8 μg/L for zopiclone, zolpidem, benzodiazepines and metabolites [Ishida *et al.* 2009]. Column: Symmetry Shield RP8 (150 × 4.6 mm i.d., 3.5 μm). Mobile phase: 0.05% formic acid in water : acetonitrile : methanol (25 : 65 : 10), flow rate 0.5 mL/min. TIS. MRM acquisition mode, positive ion mode. Limit of quantification, 0.5 μg/L for zopiclone and *N*-desmethylzopiclone and 1 μg/L for zopiclone *N*-oxide [Mistri *et al.* 2008]. Column: Merck LiChroCART with Superspher 60 RP Select B stationary phase. Mobile phase: ammonium formate : acetonitrile. APCI. Zopiclone and benzodiazepines and related drugs [Kratzsch *et al.* 2004].

Serum HPTLC Plate: silica gel 60 F₂₅₄ (100 × 100 mm). Mobile phase 1: cyclohexane : toluene : diethylamine (75 : 15 : 10); mobile phase 2: chloroform : methanol (90 : 10); mobile phase 3: chloroform : acetone (80 : 20). Dragendorff's Reagent. UV detection (λ = 366 nm). R_f 0.21 (mobile phase 1); R_f 0.71 (mobile phase 2); R_f 0.60 (mobile phase 3). Limit of detection, 100 μg/L [Otsubo *et al.* 1995].

GC Column: DB 5 (5 m × 0.32 mm i.d., 0.17 μm). Carrier gas: N₂, 50 cm/s. Temperature: 230°. NSD. Limit of quantification, 5 μg/L for zopiclone and zolpidem [Debruyne *et al.* 1991].

HPLC Column: LiChroCART 15-25-4 packed with LiChrospher 60 RP select B (5 μm). Mobile phase: acetonitrile : monopotassium phosphate (20 : 80). Limit of detection, 15 μg/L [Yang, Rochholz 2002].

Urine GC-MS See Blood [Rohrig *et al.* 2010].

HPLC Column: Nucleosil C₁₈ (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 0.1 mol/L sodium dihydrogen phosphate (pH 5.1, 35 : 65), flow rate 1.0 mL/min. UV detection (λ = 300 nm). Limit of detection, 100 μg/L [Nordgren *et al.* 2002]. Column: Spherisorb ODS-2 (200 × 4.6 mm i.d., 5 μm). Mobile phase: 0.025 mol/L monobasic sodium phosphate: methanol (45 : 55), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 300 nm, λ_{em} = 470 nm). Limit of detection, 5 μg/L for zopiclone and 10 μg/L for metabolites [Le Liboux *et al.* 1987].

LC-MS Limit of detection, <0.5 μg/L for zopiclone, zolpidem and benzodiazepines [Deveaux *et al.* 2008]. Column: Waters XTerra MS C₁₈ (150 × 2.1 mm i.d., 5 μm). Mobile phase: acetonitrile-2 mmol/L ammonium formate (pH 3, 90 : 10) : 2 mmol/L ammonium formate (pH 3, 30 : 70 to 36 : 64 in 4 min for 4.5 min to 90 : 10 in 3.5 min to 30 : 70 in 1.5 min), flow rate 0.2 mL/min. ESI, positive ion mode, SRM acquisition mode. Retention time: 2.3 min. Limit of detection, 0.01 μg/L [Quintela *et al.* 2006]. Column: XTerra MS C₁₈. Mobile phase: methanol : formate buffer. MRM acquisition mode. Limit of quantification, 10–25 μg/L for zopiclone, zolpidem, benzodiazepines and metabolites [Laloup *et al.* 2005]. Limit of detection, <100 μg/L [Bickeboeller-Friedrich, Maurer 2001].

CE Capillary: fused silica (400/470 mm effective/total length, 50 μm). Mobile phase: 100 mmol/L phosphate buffer (pH 2.75): 16.3 mmol/L β-cyclodextrin. UV laser-induced fluorescence detection (λ_{ex} = 325 nm, λ_{em} = 450 nm). Limit of detection, 6 μg/L [Hempel, Blaschke 1996].

Oral Fluid CE See Urine [Hempel, Blaschke 1996].

Hair LC-MS Column Zorbax SB-Phenyl (100 × 2.1 mm i.d., 3.5 μm). Mobile phase: 25 mmol/L formic acid: acetonitrile (98 : 2 to 80 : 20 for 3 min to 10 : 90 in 4 min for 2 min), flow rate 0.25 mL/min. ESI, positive ion mode. Limit of quantification, 0.005 ng/mg [Hegstad *et al.* 2008]. Column: XTerra MS C₁₈. Mobile phase: methanol : formate buffer. MRM acquisition mode. Limit of quantification, 0.5–10 ng/g for zopiclone, zolpidem, benzodiazepines and metabolites [Laloup *et al.* 2005]. Column: XTerra MS C₁₈ (100 × 2.1 mm i.d., 3.5 μm). Mobile phase: acetonitrile : formate buffer (5 : 95 at time 0 to 60 : 40 at 3 min to 80 : 20 at 7 min until 10 min to 5 : 95 at 10.5 min for 9.5 min), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of detection, 0.3 pg/mg [Villain *et al.* 2004].

Disposition in the Body Zopiclone is rapidly absorbed after oral administration and is also widely distributed into breast milk. It is extensively metabolised in the liver by demethylation, oxidation and decarboxylation. The 2 major metabolites excreted in urine are zopiclone *N*-oxide and *N*-demethylzopiclone (inactive). Approximately 50% of a dose is converted by decarboxylation to inactive metabolites, some of which are partly eliminated via the lungs as carbon dioxide. Only 5% of a dose is excreted unchanged in urine and ~16% appears in faeces, the remaining dose being excreted as metabolites.

Therapeutic Concentration The serum therapeutic concentration range is 0.01–0.05 mg/L, with a peak of 0.04–0.07 mg/L.

Twelve male Caucasians, 19–36 years old, were administered a single oral dose of 15 mg zopiclone after an overnight fast. After 93.8 min, the total drug concentration was 0.131 mg/L (0.087 mg/L as the (+)-enantiomer and 0.044 mg/L as the (–)-enantiomer, observed at 98.8 and 88.8 min, respectively) [Fernandez *et al.* 1993].

Twelve healthy, lactating women between 2 and 6 days after childbirth and aged 20–45 years were administered 7.5 mg oral zopiclone. The mean peak plasma concentration was 0.08 mg/L at 1.6 h, and the mean milk concentration was 0.034 mg/L at 2.4 h [Matheson *et al.* 1990].

Toxicity The serum toxic concentration is 0.15 mg/L.

A 25-year-old man had ingested 300 mg zopiclone in a suicide attempt. The maximum plasma concentration was measured as 1.6 mg/L at 4.5 h post-ingestion [Royer-Morrot *et al.* 1992].

The postmortem blood concentrations of 2 individuals, 1 who had taken 30 tablets of 7.5 mg zopiclone and 1 who had taken up to 100 tablets of 7.5 mg zopiclone, were 0.62 mg/L and 1.70 mg/L, respectively [Boniface *et al.* 1992].

Blood concentrations of zopiclone in a 29-year-old woman who had committed suicide, were between 0.9 and 2.0 mg/L using 10 distinct blood samples. The following postmortem tissue concentrations were reported: portal venous blood 3.0 mg/L, spleen 5.8 mg/L, brainstem 2.8 mg/L, myocardium 1.6 mg/L, kidney 1.7 mg/L and liver 4.9 μg/g [Pounder, Davies 1994].

A 72-year-old man who took 90 mg zopiclone, died 4 to 10 h after ingestion. Postmortem zopiclone levels were 254 μg/L in femoral blood, 408 μg/L in cardiac blood, 94 μg/L in vitreous humour, 7.330 mg/L in urine and 114.700 mg/L in bile [Meatherall 1997].

A 72-year-old woman who had taken an overdose of zopiclone (probably 200–350 mg) had postmortem femoral blood levels of 1.9 mg/L [Bramness *et al.* 2001].

A case report describes excessive use of zopiclone in a 67-year-old man who increased his dose of zopiclone from 7.5 mg daily up to 337.5 mg daily [Kuntze *et al.* 2002].

Half-life Plasma half-lives are zopiclone 3.5–6.5 h, zopiclone *N*-oxide 3.5–6.0 h and *N*-desmethylzopiclone 7–11 h.

Volume of Distribution ≈100 L/kg.

Clearance Plasma clearance, 13.9 L/h, also reported as 17.3 L/h (7.5 mg dose).

Protein Binding 45–80%.

Note For reviews of zopiclone, see Goa, Heel [1986] and Noble *et al.* [1998]; for a review of the pharmacokinetics of zopiclone, see Fernandez *et al.* [1995].

Dose The usual dose is 7.5 mg at night, increased to 15 mg if necessary. Initially 3.75 mg may be given to the elderly and those with hepatic/renal impairment and increased if necessary.

Zotepine

Antipsychotic

C₁₈H₁₈ClNOS = 331.9

CAS—26615-21-4

IUPAC Name 2-(8-Chlorobenzo[*b*][1]benzothiepin-6-yl)oxy-*N,N*-dimethylethanamine

Synonym 2-[(8-Chlorodibenzo[*b,f*]-thiepin-10-yl)oxy]-*N,N*-dimethylethylamine

Proprietary Names *Lodopin*; *Nipolept*; *Zoleptil*.

Chemical Properties Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

Gas Chromatography System GA—RI 2660; system GT—RI 2440 [Tanaka *et al.* 1996].

High Performance Liquid Chromatography Column: Nova-Pak, C₁₈ (150 × 3.9 mm i.d., 4 μm). Mobile phase: acetonitrile:0.067 mol/L phosphate (pH 7.95, 45:55), flow rate 1.0 mL/min. IS: diazepam. UV detection (λ = 304 nm). Retention time: 2.6 min zotepine, 4.7 min IS [Paw, Misztal 2000].

Ultraviolet Spectrum Aqueous acid (methanol)—215, 264, 297 nm.

Infrared Spectrum

Mass Spectrum Principal ions at *m/z* 208, 199, 221, 163, 231, 147, 281, 244.

Quantification

Blood GC Column: Shimadzu CBP-1-bonded methyl silicone (12 m × 0.53 mm i.d., 1.0 μm). Carrier gas: He, 10 mL/min. Temperature programme: 200° for 2 min to 300° at 10°/min for 2 min. NPD. Limit of detection, not reported [Jitsufuchi *et al.* 1995].

Plasma GC Column: CBP1-bonded methyl silicone (12 m × 0.53 mm i.d., 1 μm). Carrier gas: He, 20 mL/min. Temperature programme: 200° for 2 min to 300° at 10°/min. NPD. Limit of detection, 10 μg/L [Tokunaga *et al.* 1996]. Column: HP-5 capillary (25 m × 0.2 mm i.d., 0.33 μm). Temperature programme: 260° to 280° at 2/min. NPD. Retention time: 7.36 min. Limit of detection, 1.0 μg/L [Ulrich *et al.* 1996].

GC-MS Column: HP-5 cross-linked 5% methyl silicone (30 m). Temperature programme: 50° for 1 min, to 300° at 40°/min. IS: clothiapine. EI ionisation, SIM acquisition mode. Retention time: zotepine 8.9 min; IS, 8.4 min. Limit of detection, 1 μg/L [Tanaka *et al.* 1996].

Serum GC See Plasma [Ulrich *et al.* 1996].

LC-MS Column: C₁₈ (50 × 4.6 mm i.d., 5 μm). Mobile phase: methanol:5 mmol/L acetic acid (pH 3.9, 20:80 to 70:30 over 4 min for 1 min), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 1.03 μg/L [Kirchherr, Kühn-Velten 2006].

Urine GC-MS Column: HP-1 cross-linked methyl silicone (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 8 min. EI ionisation at 70 eV. Limit of detection, <100 μg/L [Bickeboeller-Friedrich, Maurer 2001].

Brain GC See Blood [Jitsufuchi *et al.* 1995].

Kidney GC See Blood [Jitsufuchi *et al.* 1995].

Liver GC See Blood [Jitsufuchi *et al.* 1995].

Muscle GC See Blood [Jitsufuchi *et al.* 1995].

Disposition in the Body Zotepine is absorbed after oral administration. Peak plasma concentrations are attained within 2–3 h. The drug undergoes extensive first-pass metabolism to the equipotent metabolite norzotepine, and inactive metabolites (hydroxylated, demethylated and *S*-oxide derivatives). CYP1A2 and CYP3A4 are the major isozymes involved [Shiraga *et al.* 1999]. It is excreted mainly in urine and faeces as metabolites (ratio 4:6) and is distributed into breast milk.

Therapeutic Concentration

Two healthy individuals were administered a single oral dose of 50 mg zotepine. The maximum plasma concentrations observed at 6 and 3 h were 31.7 and 31.0 μg/L, respectively. A second peak was also observed 10–12 h after administration [Tanaka *et al.* 1996].

Toxicity

A 46-year-old schizophrenic man died in hospital. The concentrations of zotepine, amongst other antipsychotic drugs, in his blood, brain, kidney, liver and muscle were 612, 832, 3801, 8605 and 1251 ng/g respectively.

Cause of death was asphyxia [Jitsufuchi *et al.* 1995].

Note For a case of neuroleptic malignant syndrome induced by zotepine therapy see Tsai *et al.* [2005].

Half-life ≈15–16 h in plasma.

Volume of Distribution 1851–2856 L.

Clearance Oral clearance, 81–1323 L/h.

Protein Binding ≈97%.

Dose Up to 300 mg daily.

Zuclopenthixol

Antipsychotic, Neuroleptic

$C_{22}H_{25}ClN_2OS = 401.0$

CAS—53772-83-1

IUPAC Name 2-[4-[(3Z)-3-(2-chlorothioxanthen-9-ylidene)propyl]piperazin-1-yl] ethanol

Synonyms (Z)-4[3-(2-Chloro-9H-thioxan-9-ylidene)propyl]-1-piperazine ethanol; Z-clopenthixol; cis-clopenthixol; α -clopenthixol; Lu 0-108.

Proprietary Names Ciatyl; Cisordinol.

Chemical Properties An off-white, granular powder (base). It is very slightly soluble in water; sparingly soluble in diethyl ether; soluble in chloroform; readily soluble in methanol and ethanol (96%). pK_a 7.6, 3.3. Log *P* (octanol/phosphate buffer pH 7.4), 3.9; Log *P* (octanol/water [pH 5.0]), 2.22. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Zuclopenthixol Acetate

$C_{24}H_{27}ClN_2O_2S = 443.0$

CAS—85721-05-7

Proprietary Name Viscoleo

Chemical Properties A yellowish, viscous oil. It is very slightly soluble in water; very soluble in alcohol, dichloromethane and ether.

Zuclopenthixol Decanoate

$C_{32}H_{43}ClN_2O_2S = 555.2$

CAS—64053-00-5

Chemical Properties A yellowish, viscous oil. It is very slightly soluble in water; very soluble in alcohol, dichloromethane and ether.

Zuclopenthixol Hydrochloride

$C_{22}H_{25}ClN_2OS \cdot 2HCl = 473.9$

CAS—633-59-0

Synonym Zuclopenthixol dihydrochloride

Proprietary Name Clopixol

Chemical Properties An off white granular powder. It is very soluble in water; sparingly soluble in alcohol; slightly soluble in chloroform; very slightly soluble in ether. A 1% solution has a pH of 2.0–3.0.

Thin-layer Chromatography System TA— R_f 0.56; system TB— R_f 0.07; system TC— R_f 0.32; system TE— R_f 0.44; system TAE— R_f 0.45; system TAG— R_f 0.11. **High Performance Liquid Chromatography** System HAA—RT 16.3 min; system HZ—RT 8.0 min.

Column: LiChrosorb RP-18 ODS silica (120 × 4.6 mm i.d., 5 μ m). Mobile phase: methanol: water: 0.2 mol/L potassium phosphate buffer (pH 4.0, 60:35:5), flow rate 1.0 mL/min. UV detection ($\lambda = 254$ nm). Retention time: ~24 and ~26 min for *cis*- and *trans*-isomers, respectively [Helboe 1990]. Column: Spherisorb (250 × 4.6 mm i.d., 5 μ m). Mobile phase ethyl acetate: methanol: 3% ammonia (85:15:1), flow rate 1.0 mL/min. UV detection ($\lambda = 260$ nm). Retention time: 8.02 and 8.89 min for the *cis* and *trans*-isomers, respectively. Limit of detection, 1.0 mg/L [Li Wan Po, Irwin 1979].

Liquid Chromatography-Mass Spectrometry Column: NovaPak, RP C_{18} (150 × 2 mm, 4 μ m). Mobile phase: methanol: 2 mmol/L ammonium acetate (pH 3, 90:10), flow rate 0.2 mL/min. ESI. Retention time: 14.95 min [Tracqui *et al.* 1997].

Ultraviolet Spectrum Aqueous solution (water)—(dihydrochloride) 208, 230, 268, 325 nm; aqueous acid (ethanol)—(acetate) 208, 231, 268, 326 nm; aqueous solution (water)—(decanoate) 208, 230, 272, 325 nm.

Infrared Spectrum

Mass Spectrum Principal ions at *m/z* 143, 70, 100, 221, 98, 42, 222, 234 (zuclopenthixol); 143, 36, 70, 144, 38, 100, 35, 56 (dihydrochloride); 185, 36, 186, 98, 87, 43, 70, 221 (acetate); 297, 298, 36, 98, 125, 143, 70, 43 (decanoate).

Quantification

Blood GC-MS Column: BPX5 (15 m × 0.22 mm i.d., 0.25 μ m). Carrier gas: He, 30 mL/min. Temperature programme: 70° for 1 min to 220° at 15°/min to 260° at 5°/min to 330° at 25°/min. MSD, EI ionisation. Retention time: 22.3 and 22.4 min for (*E*-) and (*Z*-) isomers, respectively [Rop 2001].

HPLC Column: Symmetry (250 × 4.6 mm i.d., 5 μ m). Mobile phase: acetonitrile: methanol: 0.1 mol/L ammonium acetate (30:30:40), flow rate 1.0 mL/min. UV detection ($\lambda = 230$ nm). Limit of quantification, 40 and 45 μ g/L for (*Z*-) and (*E*-) isomers, respectively [Rop 2001]. Column: Spherisorb, S5 CN (120 × 4.6 mm). Mobile phase: acetonitrile: 200 mmol/L potassium phosphate (pH 6.5, 36:5:59), flow rate 1 mL/min. Fluorescence detection ($\lambda_{ex} = 260$ nm, $\lambda_{em} = 435$ nm). Retention time: 9 min. Limit of detection, 0.05 μ g/L [Hansen, Hansen 1994]. Column: NovaPak, C_{18} (300 × 3.9 mm, 4 μ m). Mobile phase: methanol: tetrahydrofuran: 10 mmol/L potassium dihydrogen phosphate (pH 2.6, 65:5:30), flow rate 0.8 mL/min. UV detection ($\lambda = 228$ nm). Retention time: 8.98 min. Limit of detection, 7 μ g/L [Tracqui *et al.* 1997]. Column: Spherisorb S5W (250 × 4.6 mm i.d., 5 μ m). Mobile phase: *n*-heptane: propan-2-ol: concentrated ammonia: water (85:15:0.4:0.2), flow rate 0.1 mL/min. Limit of detection, 0.5 μ g/L [Aaes-Jorgensen 1980].

LC-MS Column: Zorbax Stable Bond Cyano (50 × 2.1 mm i.d., 3.5 μ m). Mobile phase: methanol-acetonitrile-20 mmol/L ammonium formate buffer (pH 4, 2:8:90): methanol-acetonitrile-20 mmol/L ammonium formate buffer (pH 4, 24:36:40, 80:20 to 20:80 in 4.5 min for 2.5 min to 80:20 for 2.5 min). TIS, MRM acquisition mode. Retention time: 6.0 min. Limit of detection, 0.8 μ g/L [Roman *et al.* 2008]. Column: Symmetry C_{18} (150 × 3.0 mm i.d., 5 μ m). Mobile phase: acetonitrile: 0.1% formic acid (10:90 to 90:10 in 10 min to 10:90 in 1 min). ESI. Limit of detection, 1 μ g/L [Kollroser *et al.* 2001].

Plasma HPLC Column: XTerra MS C_{18} (150 × 3.9 mm i.d., 5 μ m). Mobile phase: acetonitrile: 62.4 mmol/L phosphate buffer (pH 4.2, 38:62), flow rate 1.0 mL/min. UV detection ($\lambda = 220$ nm). Relative retention time: 4.29 min. Limit of quantification, 20 μ g/L, limit of detection, 9 μ g/L [Garay Garcia *et al.* 2003]. Column:

Microsorb MVC₈ (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 25 mmol/L phosphate buffer (pH 3.0, 35 : 65), with 0.25% TEA. UV detection (λ = 230 nm). Retention time: 7.4 and 7.9 min for the (Z)- and (E)-isomers, respectively. Limit of quantification, 1 µg/L, limit of detection, 0.3 µg/L [Pucci *et al.* 2003]. Column: Phenomenex Luna C₁₈ (100 × 2.0 mm i.d., 3 µm). Mobile phase: 40 mmol/L phosphate buffer (pH 7.5) : acetonitrile (52 : 48), flow rate 0.3 mL/min. UV detection (λ = 258 nm). Retention time: 7.12 min. Limit of detection, 1.0 nmol/L [Jaanson *et al.* 2002].

Serum HPLC Column: S5 CN Spherisorb (150 × 4.6 mm i.d.). Mobile phase: 10 mmol/L ammonium acetate buffer : methanol (1 : 9), flow rate 0.6–1.7 mL/min. UV detection (λ = 256 and 245 nm). Limit of quantification, 5 nmol/L [Angelo, Petersen 2001]. Limit of detection, 0.5 µg/L [Aaes-Jorgensen *et al.* 1986].

LC-MS Column: C₁₈ (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 5 mmol/L acetic acid (pH 3.9, 20 : 80 to 70 : 30 over 4 min for 1 min), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.47 µg/L [Kirchherr, Kühn-Velten 2006]. Column: Uptisphere (125 × 2 mm i.d., 5 µm). Mobile phase: 50 mmol/L ammonium acetate (pH 4.0) : acetonitrile : acetonitrile (92 : 8), flow rate 200 µL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 5 nmol/L [Guttek, Rentsch 2003].

Urine HPLC See Blood [Hansen, Hansen 1994; Rop 2001; Tracqui *et al.* 1997] UV detection (λ = 228 nm).

Breast Milk HPLC See Serum [Aaes-Jorgensen *et al.* 1986].

Gastric Contents HPLC See Blood [Rop 2001]. See Blood [Tracqui *et al.* 1997].

Vitreous Humour HPLC See Blood [Tracqui *et al.* 1997].

Hair LC-MS Column: RP-C8-select B (125 × 2 mm i.d., 5 µm). Mobile phase: 1 mmol/L ammonium formate with 0.1% formic acid (pH 3) : acetonitrile with 0.1% formic acid (90 : 10 to 70 : 30 at 6.6 min to 30 : 70 at 26.6 min to 10 : 90 at 33.3 min. MRM acquisition mode. Limit of quantification, 0.024 ng/mg, limit of detection, 0.008 ng/mg [Weinmann *et al.* 2002].

Disposition in the Body Following IM injections, the acetate and decanoate esters of zuclopendixol are hydrolysed to release zuclopendixol. The acetate has a quick onset after injection, with a duration of action of 2–3 h, which is shorter than for the decanoate. The drug is rapidly absorbed from the gastrointestinal tract. First-pass metabolism occurs in the gut wall, and the drug is also extensively metabolised in the liver. Metabolism occurs by sulfoxidation, side-chain N-dealkylation and glucuronic acid conjugation [Khan 1969]. One known metabolite of zuclopendixol is *trans*-(E)-clopendixol. The drug is widely distributed in the body, with higher concentrations in the liver, lung, intestine and kidney. It is excreted mainly in faeces, but also in urine, in the form of numerous metabolites. There is evidence of enterohepatic recycling and wide intersubject variation in plasma concentration. The drug also displays linear kinetics. CYP2D6 plays a significant role in the systemic elimination of zuclopendixol [Jaanson *et al.* 2002].

Therapeutic Concentration

Nineteen acutely disturbed Asian patients aged between 18 and 67 years, the majority of whom were suffering from schizophrenia, acute psychosis or mania, were administered 50 mg zuclopendixol acetate (Viscoleo) by IM injection. The mean serum drug concentrations were taken at 24, 48 and 72 h after administration, and were 19.9 µg/L (range 8–41.5), 31.5 µg/L (range 12.8–52) and 17.8 µg/L (range 8–28.8), respectively. The *trans*-(E)-clopendixol concentrations ranged between negligible and 39.5 µg/L [Tan *et al.* 1993].

Toxicity

Postmortem samples were obtained from a 16-year-old Caucasian female who died 40 h after ingesting an undetermined number of clopixol 10 tablets (10 mg each). The following postmortem tissue concentrations were reported: blood 391 µg/L, urine 957 µg/L, gastric contents 105.4 µg/g, liver 0.75 µg/g, kidney 1.413 µg/g, lung 5.21 µg/g, brain 0.12 µg/g [Tracqui *et al.* 1997].

A 26-year-old man was found dead and the postmortem zuclopendixol concentrations (µg/L) were as follows:

	Peripheral blood (µg/L)	Cardiac blood (µg/L)	Gastric contents (µg/L)	Urine (µg/L)
(Z)- <i>cis</i> -Clopendixol	278	455	29880	505
(E)- <i>trans</i> -Clopendixol	177	245	1680	230
Total	455	700	31560	735

[Rop 2001]

A 39-year-old woman was found dead. Heart and peripheral blood concentrations zuclopendixol were 0.68 and 0.60 mg/L, respectively [Kollroser *et al.* 2001].

Note For a case of an 8-year-old child with X-linked cerebral adrenoleukodystrophy developing neuroleptic malignant syndrome when his zuclopendixol was increased, see Rubio-Gozalbo *et al.* [2001]; for a 14-year-old girl with neuroleptic malignant syndrome, see Erermis *et al.* [2007]; for three patients with neuroleptic malignant syndrome, see Kemperman, van den Hoofdakker [1990].

Half-life Zuclopendixol, mean 20 h (range 12–29 h); zuclopendixol hydrochloride, 1 day.

Volume of Distribution 15–20 L/kg.

Clearance Systemic clearance, 0.9 L/min.

Protein Binding 98%.

Note For a review of the clinical physiognomy of zuclopendixol see Rimestad [1974].

Dose Zuclopendixol acetate 50 to 150 mg (1 to 3 mL); zuclopendixol decanoate 200 to 500 mg every 1 to 4 weeks, with a maximum of 600 mg weekly; zuclopendixol hydrochloride doses between 4 and 150 mg daily have been administered but the usual dose is 20 to 50 mg.

Al	CdO	C₂Cl₄
Aluminium	Cadmium Oxide	Tetrachloroethylene
AlCl₃	CdS	C₂CaO₄
Aluminium Chloride	Cadmium Sulfide	Calcium Oxalate
AlF₆Na₃	CdSO₄	C₂HCl₃
Cryolite	Cadmium Sulfate	Trichloroethylene
AlN₃O₉·9H₂	Cu	C₂H₂AsCl₃
Aluminium Nitrate	Copper	Lewisite
Al(OH)₃	CuSO₄	C₂H₂Cl₄
Aluminium Hydroxide	Copper Sulfate	Tetrachloroethane
AlP	CClF₂·CClF₂	C₂H₂FNaO₂
Aluminium Phosphide	Cryofluorane	Sodium Fluoroacetate
AlPO₄	CCl₂F₂	C₂H₂O₄
Aluminium Phosphate	Dichlorodifluoromethane	Oxalic Acid
[Al₂(OH)₅Cl]_x	CCl₃CH₃	C₂H₃Cl₃NaO₄P
Aluminium Chlorhydrate	Trichloroethane	Triclofos Sodium
Al₂O₃	CCl₃F	C₂H₃Cl₃O
Aluminium Oxide	Trichlorofluoromethane	Trichloroethanol
Al₂(SO₄)₃	CC₃NO₂	C₂H₃Cl₃O₂
Aluminium Sulfate	Chloropicrin	Chloral Hydrate
Al₃O₂[C₆H₄(OOCCH₃)COO]₅	CCl₄	C₂H₃FO₂
Aloxiprin	Carbon Tetrachloride	Fluoroacetic Acid
As	CF₃CHBrCl	C₂H₄N₄
Arsenic	Halothane	Aminotriazole
AsH₃O₄	CHCl₃	C₂H₄O
Arsenic Acid	Chloroform	Acetaldehyde
As₂O₃	CH₂Cl₂	(C₂H₄O)_x
Arsenic Trioxide	Methylene Chloride	Metaldehyde
As₂O₅	CH₂Cl₂Na₂O₆P₂	(C₂H₄O)₃
Arsenic Pentoxide	Disodium Clodronate	Paraldehyde
Be	CH₂O	(C₂H₅)₂O
Beryllium	Formaldehyde	Ether
BeCl₂	(CH₃)₂As(O)OH	C₂H₆AsNaO₂
Beryllium Chloride	Dimethylarsinic Acid	Sodium Cacodylate
BeF₂	(CH₃)₃As⁺CH₂CO₂⁻	C₂H₆Hg
Beryllium Fluoride	Arsenobetaine	Dimethylmercury
Be(NO₃)₂	CH₃Br	C₂H₆OS
Beryllium Nitrate	Methyl Bromide	Dimethyl Sulfoxide
BeO	CH₃Br·20H₂O	C₂H₆O₂
Beryllium Oxide	Crystal Hydrate	Ethylene Glycol
Be(OH)₂	CH₃CH₂OH	C₂H₇NO
Beryllium Hydroxide	Ethanol	Monoethanolamine
Bi	CH₃·COOH	C₂H₇NO, C₁₈H₃₄O₂
Bismuth	Acetic Acid Glacial	Monoethanolamine Oleate
BrH₄N	CH₃C₆H₄OH	C₂H₈NO₂PS
Ammonium Bromide	Cresol	Methamidophos
BrK	CH₃H₂AsO₃	C₂H₈N₂·H₂O
Potassium Bromide	Methanearsonic Acid	Ethylenediamine Hydrate
BrNa	CH₃NaHAsO₃	C₂K₂O₄
Sodium Bromide	Sodium Methanearsonate	Potassium Oxalate
Br₂Ca	CH₃Na₂AsO₃	C₂Na₂O₄
Calcium Bromide	Disodium Methanearsonate	Sodium Oxalate
BaCl₂	CH₃OH	C₃H₂ClF₅O
Barium Chloride	Methanol	Enflurane
Ba(CH₃CO₂)₂	CH₄Cl₂O₆P₂	C₃H₂F₆O
Barium Acetate	Clodronic Acid	Desflurane
Ba(CN)₂	CH₄N₂O	C₃H₃N₃O₂S
Barium Cyanide	Urea	Aminonitrothiazole
BaCO₃	CH₄N₂O₂	C₃H₄Cl₂F₂O
Barium Carbonate	Hydroxycarbamide	Methoxyflurane
BaO	CN	C₃H₄O
Barium Oxide	Cyanide	Acrolein
Ba(OH)₂	CNBr	C₃H₅BrO
Barium Hydroxide	Cyanogen Bromide	Bromoacetone
BaSO₄	CNCl	C₃H₅N₃O₉
Barium Sulfate	Cyanogen Chloride	Glycerol Trinitrate
Ba²⁺	CNa₃O₃P	C₃H₆N₂O₂
Barium	Foscarnet Sodium	Cycloserine
Cd	COCl₂	C₃H₆O
Cadmium	Phosgene	Acetone
CdCl₂	Ca(C₅H₁₀NO₄S)₂	C₃H₇NO₂
Cadmium Chloride	Acamprosate Calcium	Urethane
CdCO₃	Ca₃(AsO₄)₂	C₃H₇OH
Cadmium Carbonate	Calcium Arsenate	Propanol

C₆H₁₃NO₃S
 Cyclamic Acid
C₆H₁₃N₂Na₃O₁₀P₂
 Glyphosate Sesquisodium Salt
C₆H₁₄O₂S₃
 1,1'-Sulfonylbis-[2-S-(methylthio)ethane]
 (metabolite)
C₆H₁₄O₆
 Mannitol
C₆H₁₄O₆S₂
 Busulfan
C₆H₁₅ClF₂N₂O₃
 Eflornithine Hydrochloride Monohydrate
C₆H₁₅ClN₂O₂
 Carbachol
C₆H₁₅N₅
 Bufornin
C₆H₁₅N₅HCl
 Bufornin Hydrochloride
C₆H₁₅O₃PS₂
 Demeton-S-(Me)
C₆H₁₇N₂O₃P
 Glyphosate Isopropylammonium
C₆H₁₈N₄
 Trientine
C₆H₁₈N₄·2HCl
 Trientine Dihydrochloride
C₇H₃IN₂O₃
 Nitroxinil
C₇H₃IN₂O₃C₈H₁₉NO₅
 Nitroxinil Eglumine Salt
C₇H₄ClNO₂
 Chlorzoxazone
C₇H₄NNaO₃S₂H₂O
 Saccharin Sodium
C₇H₅ClN₃NaO₄S₂
 Chlorothiazide Sodium
C₇H₅Cl₂NO₄S
 Halazone
C₇H₅NO₃S
 Saccharin
C₇H₅NaO₃
 Sodium Salicylate
C₇H₅O₂Na
 Sodium Benzoate
C₇H₆ClNO₂
 Chloronitrotoleuene
C₇H₆ClN₃O₄S₂
 Chlorothiazide
C₇H₆KNO₂
 Potassium Aminobenzoate
C₇H₆KNO₃
 Potassium Aminosalicilate
C₇H₆NNaO₃·2H₂O
 Sodium Aminosalicilate
(C₇H₆NO₃)₂Ca₃H₂O
 Calcium Aminosalicilate
C₇H₆N₂O₅
 Dinitro-orthoresol
C₇H₆O₂
 Benzoic Acid
C₇H₆O₃
 Salicylic Acid
C₇H₆O₄
 Patulin
C₇H₇ClNNaO₂S₃H₂O
 Tosylchloramide Sodium
C₇H₇ClNa₂O₆P₂S
 Disodium Tiludronate
C₇H₇ClO
 Chlorocresol
C₇H₇Cl₂NO
 Clopidol
C₇H₇C₁₃NO₃PS
 Chlorpyrifos-(Me)
C₇H₇NO₂
 Aminobenzoic Acid
C₇H₇NO₂
 Methyl Nicotinate
C₇H₇NO₂
 Salicylamide
C₇H₇NO₃
 Aminosalicilic Acid
C₇H₇N₃NaO₂:C₂H₅NO₂
 Theophylline Sodium Glycinate
C₇H₈BrNO₂
 Brocresine
C₇H₈CIN
 Chloromethylaniline
C₇H₈ClN₃O₄S₂
 Hydrochlorothiazide
C₇H₈N₄O₂
 Theobromine
C₇H₈N₄O₂
 Theophylline
(C₇H₈N₄O₂)₂·C₂H₄(NH₂)₂·2H₂O
 Aminophylline
C₇H₈N₄O₂·C₂H₇NO
 Theophylline Monoethanolamine
C₇H₈N₄O₂·H₂O
 Theophylline Hydrate
C₇H₈O
 Benzyl Alcohol
C₇H₉AsN₂O₄
 Carbarsone
C₇H₉ClN₂O
 Pralidoxime Chloride
C₇H₉ClN₂O₄S₂
 Disulfamide
C₇H₉ClO
 Ethchlorvynol
C₇H₉ClO₆P₂S
 Tiludronic Acid
C₇H₉IN₂O
 Pralidoxime Iodide
C₇H₉NO₂
 Deferiprone
C₇H₉N₃O₂S₂H₂O
 Sulfacarbamide
C₇H₁₀NNaO₇P₂
 Risedronate Sodium
C₇H₁₀N₂OS
 Propylthiouracil
C₇H₁₀N₂O₂S
 Carbimazole
C₇H₁₀N₂O₂S
 Mafenide
C₇H₁₀N₂O₂S₂C₂H₄O₂
 Mafenide Acetate
C₇H₁₀N₂O₂S₂C₃H₆O₂
 Mafenide Propionate
C₇H₁₀N₂O₂S₂HCl
 Mafenide Hydrochloride
C₇H₁₀N₄O₂S
 Sulfaguandine
C₇H₁₀N₄O₂S₂H₂O
 Sulfaguandine Monohydrate
C₇H₁₁NO₂
 Ethosuximide
C₇H₁₁NO₂
 Methylpentynol Carbamate
C₇H₁₁NO₃
 Paramethadione
C₇H₁₁NO₇P₂
 Risedronic Acid
C₇H₁₂ClN₅
 Simazine
C₇H₁₂Cl₃NO₃H₂O
 Chloral Betaine
C₇H₁₃BrN₂O₂
 Carbromal
C₇H₁₃O₆P
 Mevinphos
C₇H₁₄NO₅P
 Monocrotophos
C₇H₁₄N₂O₂S
 Aldicarb
C₇H₁₄N₄S₂
 Metallibure
C₇H₁₄O₂
 Amyl Acetate
C₇H₁₅Cl₂N₂O₂P₂H₂O
 Cyclophosphamide
C₇H₁₅NO₂
 Emylcamate
C₇H₁₆BrNO₂
 Acetylcholine Bromide
C₇H₁₆ClNO₂
 Acetylcholine Chloride
C₇H₁₆FO₂P
 Soman
C₇H₁₆N₄O₄S₂
 Taurolin
C₇H₁₆O₄S₂
 Sulfonal
C₇H₁₇ClN₂O₂
 Bethanechol Chloride
C₇H₁₇N
 Methylhexaneamine
C₇H₁₇N
 Tuaminoheptane
(C₇H₁₇N)₂·H₂SO₄
 Tuaminoheptane Sulfate
C₇H₂₇NO₄
 Nadolol
C₈H₄N₂S₂
 Bitoscanate
C₈H₅Cl₃O₃
 Trichlorophenoxyacetic Acid
C₈H₅F₃N₂OS
 Riluzole
C₈H₅N₄NaO₅
 Nitrofurantoin Sodium
C₈H₆Cl₂O₃
 Dicamba
C₈H₆Cl₂O₃
 Dichlorophenoxyacetic Acid
C₈H₆N₄O₅
 Nitrofurantoin
C₈H₇ClN₂O₂S
 Diazoxide
C₈H₇ClO
 CN Gas
C₈H₇C₁₄N₃O₄S₂
 Teclorhiazide
C₈H₇NaO₃
 Sodium Methyl Hydroxybenzoate
C₈H₇N₃O₅
 Dinitolmide
C₈H₇N₃O₅
 Furazolidone
(C₈H₇O₃)₂Ca
 Calcium Mandelate
C₈H₇O₃NH₄
 Ammonium Mandelate
C₈H₈Cl₃N₃O₄S₂
 Trichlormethiazide
C₈H₈F₃N₃O₄S₂
 Hydroflumethiazide
C₈H₈N₂O₃S
 Zonisamide
C₈H₈N₄
 Hydralazine
C₈H₈N₄HCl
 Hydralazine Hydrochloride
C₈H₈O₃
 Mandelic Acid
C₈H₈O₃
 Methyl Hydroxybenzoate
C₈H₈O₃
 Methyl Salicylate
C₈H₈O₃
 Resorcinol Monoacetate

 Phentermine Hydrochloride
 $C_{10}H_{15}N,HCl$
 Phenylpropylmethylamine Hydrochloride
 $C_{10}H_{15}NO$
 Anhydrous Ephedrine
 $C_{10}H_{15}NO$
 Hordenine
 $C_{10}H_{15}NO$
 Methoxyamphetamine
 $C_{10}H_{15}NO$
 Pholedrine
 $C_{10}H_{15}NO$
 Pseudoephedrine
 $C_{10}H_{15}NO$
 Racedrine
 $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$
 Ephedrine Sulfate
 $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$
 Pholedrine Sulfate
 $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$
 Pseudoephedrine Sulfate
 $(C_{10}H_{15}NO)_2 \cdot H_2SO_4, 2H_2O$
 Hordenine Sulfate
 $C_{10}H_{15}NO,HCl$
 Ephedrine Hydrochloride
 $C_{10}H_{15}NO,HCl$
 Methoxyamphetamine Hydrochloride
 $C_{10}H_{15}NO,HCl$
 Pseudoephedrine Hydrochloride
 $C_{10}H_{15}NO,HCl$
 Racedrine Hydrochloride
 $C_{10}H_{15}NO,1\frac{1}{2}H_2O$
 Ephedrine
 $C_{10}H_{15}NO_2$
 Etilofrine
 $C_{10}H_{15}NO_2$
 Hydroxyephedrine
 $C_{10}H_{15}NO_2,HCl$
 Etilofrine Hydrochloride
 $C_{10}H_{15}NO_2,HCl$
 Hydroxyephedrine Hydrochloride
 $C_{10}H_{15}NO_3$
 Ethylnoradrenaline
 $C_{10}H_{15}NO_3$
 Metadrenaline
 $C_{10}H_{15}NO_3,HCl$
 Ethylnoradrenaline Hydrochloride
 $C_{10}H_{15}NS$
 Methylthioamphetamine
 $C_{10}H_{15}N_2NaO_3$
 Secbutabarital Sodium
 $C_{10}H_{15}N_3$
 Bethanidine
 $(C_{10}H_{15}N_3)_2 \cdot H_2SO_4$
 Bethanidine Sulfate
 $C_{10}H_{15}N_3O_5$
 Benserazide
 $C_{10}H_{15}N_3O_5,HCl$
 Benserazide Hydrochloride
 $C_{10}H_{15}N_5$
 Phenformin
 $C_{10}H_{15}N_5,HCl$
 Phenformin Hydrochloride
 $C_{10}H_{15}N_5O_3$
 Penciclovir
 $C_{10}H_{15}N_5O_3Na,H_2O$
 Penciclovir Sodium
 $C_{10}H_{15}O_3PS_2$
 Fenthion
 $C_{10}H_{16}Br_2N_2O_2$
 Pipobroman
 $C_{10}H_{16}ClNO$
 Edrophonium Chloride
 $C_{10}H_{16}NO_3PS_2$
 Famphur
 $C_{10}H_{16}N_2O$
 Rilmenidene
 $C_{10}H_{16}N_2O,1\frac{1}{4}C_4H_4O_4$
 Rilmenidene Fumarate
 $C_{10}H_{16}N_2O,H_3PO_4$
 Rilmenidene Phosphate
 $C_{10}H_{16}N_2O_3$
 Butobarbital
 $C_{10}H_{16}N_2O_3$
 Secbutabarbital
 $C_{10}H_{16}N_2O_3S$
 Amidefrine
 $C_{10}H_{16}N_2O_3S,CH_3SO_3H$
 Amidefrine Mesilate
 $C_{10}H_{16}N_2O_4S_3$
 Dorzolamide
 $C_{10}H_{16}N_2O_4S_3,HCl$
 Dorzolamide Hydrochloride
 $C_{10}H_{16}N_5O_{13}P_3$
 Adenosine Triphosphate
 $C_{10}H_{16}N_6S$
 Cimetine
 $C_{10}H_{16}O$
 Camphor
 $C_{10}H_{17}N$
 Amantadine
 $C_{10}H_{17}N,HCl$
 Amantadine Hydrochloride
 $C_{10}H_{17}N,1\frac{1}{2}H_2SO_4$
 Amantadine Sulfate
 $C_{10}H_{17}NO_2$
 Methpyrrolon
 $C_{10}H_{17}N_3S$
 Pramipexole
 $C_{10}H_{17}N_3S,2HCl,H_2O$
 Pramipexole Dihydrochloride Monohydrate

 Antimony Trioxide
Sb₂O₅
 Antimony Pentoxide
Sb₂S₃
 Antimony Trisulfide
Sb₂S₅
 Antimony Pentasulfide

3 Functional Classes: Therapeutic

Adrenocortical Suppressant

Trilostane

Aid to Smoking Cessation

Nicotine

Anabolic Steroid (Veterinary)

Zeranol

Anaesthetic (General)

Chloroform

Anaesthetic (Local)

Amolanone
Amydracaine
Benzamine
Bupivacaine
Butanilicaine
Butethamine
Butyl Aminobenzoate
Chloroprocaine
Cocaine
Dimethocaine
Etidocaine
Isobutyl Aminobenzoate
Leucinoacaine
Lidocaine
Mepivacaine
Metabutethamine
Metabutoxycaine
Naepaine
Octacaine
Orthocaine
Oxetacaine
Prilocaine
Procaine
Pyrrocaine
Ropivacaine
Tetracaine
Tolycaine
Tropacocaine
Xenysalate

Analgesic

Acetanilide
Alclofenac
Aletamine
Aloxiprin
Aminophenazone
Aspirin
Azapropazone
Benorilate
Benoxaprofen
Benzylamine
Bufexamac
CP 47,497

Cinchophen
Clonixin
Dexmedetomidine
Diclofenac
Diflunisal
Dioxyamidopyrine
Dipyron
Droxicam
Eptazocine
Etenzamide
Etofenamate
Etoricoxib
Etoxazene
Etymide
Famprofazone
Fenbufen
Fenclofenac
Fendosal
Fenoprofen
Fenyramidol

Flufenamic Acid
Flunixin
Flupirtine
Flurbiprofen
Glafenine
Ibuprofen
Indometacin
Indoprofen
JWH-018
Ketoprofen
Ketorolac
Lornoxicam
Loxoprofen
Meclofenamic Acid
Mefenamic Acid
Methyl Salicylate
Metofoline
Morazone
Naproxen
Nefopam
Nifenazone
Niflumic Acid
Oxyphenbutazone
Paracetamol
Phenacetin
Phenazone
Phenazopyridine
Phenylbutazone
Piroxicam
Propyphenazone
Remifentanil
Salicylamide
Salicylic Acid
Salol
Salsalate
Sulindac
Suprofen
Tenoxicam
Tiaprofenic Acid
Tolfenamic Acid
Tolmetin
Valdecoxib
Zomepirac

Analgesic (Veterinary)

Isopropylaminophenazone
Xylazine

Anaplasmodastat (Veterinary)

Gloxazone

Anorectic

Benzfetamine
Cathine
Chlorphentermine
Clobenzorex
Dexamfetamine
Diethylpropion
Fenbutrazate
Fenfluramine
Fenproporex
Levamisole
Mazindol
Phendimetrazine
Phenmetrazine
Phentermine
Propylhexedrine

Anthelmintic

Bephenium Hydroxynaphthoate
Bitoscanate
Bromofenofos
Dichlorophen
Fenbendazole
Hexylresorcinol
Levamisole
Mebendazole
Niclosamide
Niridazole
Piperazine
Pyrantel
Pyrvinium Embonate
Santonin
Stilbazium Iodide
Tetrachloroethylene
Tiabendazole
Trichlorfon

Anthelmintic (Veterinary)

Albendazole
Bunamidine
Clioquinide
Diamfenetide
Haloxon
Methyridine
Morantel
Nitroxinil
Oxyclozanide
Parbendazole
Phenothiazine
Rafoxanide
Resorantel
Tetramisole
Thenium Closilate

Antiallergic

Ketotifen
Omalizumab
Sodium Cromoglicate

Antiamoebic

Bialamicol
Carbarsone
Clamoxiquin
Clefamide
Clioquinol
Conessine
Diiodohydroxyquinoline
Diloxanide
Emetine
Panidazole
Phanquinone

Antianginal

Diltiazem
Lidoflazine
Limaprost
Metoprolol
Nicorandil
Perhexiline
Prenylamine
Sotalol

Antianginal Vasodilator

Amyl Nitrite
Carbocromen
Dipyridamole
Glyceryl Trinitrate
Hexobendine
Imolamine
Isosorbide Dinitrate
Isosorbide Mononitrate
Nifedipine
Pentaerithryl Tetranitrate
Trimetazidine

Antiarrhythmic

Acecaïnide
Adenosine
Ajmaline
Amiodarone
Aprindine
Bretylum Tosilate
Cibenzoline
Detajmium
Diltiazem
Disopyramide
Dofetilide
Encainide
Flecainide
Hydroquinidine
Ibutilide
Ipratropium
Landiolol
Lidocaine
Lorcainide
Metoprolol
Mexiletine
Moracizine
Nifekalant
Prajmalium Bitartrate
Procainamide
Quinidine

Sotalol
Tocainide
Verapamil

Antiarrhythmic (Coronary)

Amotriphene

Antiarthritic

Diacerein

Antiasthmatic

Formoterol
Montelukast
Nedocromil
Pranlukast
Zafirlukast

Antibacterial

Amikacin
Amoxicillin
Azithromycin
Azlocillin
Aztreonam
Bacampicillin
Capreomycin
Cefaclor
Cefdinir
Cefixime
Ceftazidime
Ceftriaxone
Chlortetracycline
Ciprofloxacin
Clarithromycin
Clomocycline
Cloponone
Demeclocycline
Dequalinium Chloride
Dirithromycin
Levofloxacin
Lymecycline
Metronidazole
Minocycline
Moxifloxacin
Ofloxacin
Oxytetracycline Dihydrate
Phanquinone
Phthalylsulfacetamide
Phthalylsulfathiazole
Procaine Benzylpenicillin
Propicillin
Rifamycin SV
Rolitetracycline
Roxithromycin
Streptomycin
Succinylsulfathiazole
Sulfachlorpyridazine
Sulfadiazine
Sulfadimethoxine
Sulfadimidine
Sulfadoxine
Sulfaethidole
Sulfafurazole
Sulfaguandine
Sulfamerazine
Sulfamethizole
Sulfamethoxyypyridazine
Sulfametopyrazine
Sulfametoxydiazine
Sulfamoxole

Sulfanilamide
Sulfaphenazole
Sulfapyridine
Sulfasalazine
Sulfasomizole
Sulfathiazole
Sulfisomidine
Taurolin
Teicoplanin
Thioacetazone
Xenysalate

Antibacterial (Topical)

Mupirocin

Antibacterial (Urinary)

Mandelic Acid
Methenamine
Nalidixic Acid
Nitrofurantoin
Nitroxoline

Antibacterial (Veterinary)

Furaltadone
Tilmicosin

Antibiotic

Ampicillin
Benzathine Benzylpenicillin
Benzylpenicillin
Carbenicillin
Cefalexin
Cefaloridine
Cefalothin
Cefradine
Chloramphenicol
Clindamycin
Cloxacillin
Cycloserine
Dihydrostreptomycin
Doxycycline
Enoxacin
Erythromycin
Flucloxacillin
Fusidic Acid
Gentamicin
Kanamycin
Lincomycin
Methacycline
Meticillin
Neomycin
Oleandomycin
Paromomycin
Pheneticillin
Phenoxyethylpenicillin
Pivampicillin
Rifamide
Spiramycin
Tetracycline
Tobramycin
Troleandomycin
Vancomycin
Viomycin

Antibiotic (Veterinary)

Tylosin

Anticholesteraeamic

Azacosterol

Anticoagulant

Acenocoumarol
 Anisindione
 Bemiparin
 Dicoumarol
 Diphenadione
 Enoxaparin
 Ethyl Biscoumacetate
 Lepirudin
 Phenindione
 Phenprocoumon
 Picotamide
 Warfarin

Anticonvulsant

Beclamide
 Carbamazepine
 Chlordiazepoxide
 Cinolazepam
 Clobazam
 Clonazepam
 Dimethadione
 Ethosuximide
 Ethotoin
 Felbamate
 Fosphenytoin
 Gabapentin
 Lamotrigine
 Mephenytoin
 Mesuximide
 Metharbital
 Oxcarbazepine
 Paraldehyde
 Paramethadione
 Phenacemide
 Phenturide
 Phensuximide
 Phenylmethylbarbituric Acid
 Phenytoin
 Primidone
 Progabide
 Sultiamine
 Tiagabine
 Tiletamine
 Trimethadione
 Valproic Acid
 Zonisamide

Antidepressant

Bupropion
 Citalopram
 Clomipramine
 Clorgiline
 Desipramine
 Dibenzepin
 Dosulepin
 Duloxetine
 Escitalopram
 Fenmetramide
 Fluoxetine
 Fluvoxamine
 Imipramine
 Iprindole
 Iproniazid
 Isocarboxazid
 Mebanazine
 Mianserin

Milnacipran
 Mirtazapine
 Moclobemide
 Nefazodone
 Nialamide
 Nomifensine
 Nortriptyline
 Noxiptiline
 Opipramol
 Paroxetine
 Phenelzine
 Phenoxypropazine
 Reboxetine
 Rolicyprine
 Rolipram
 Sertraline
 Setiptiline
 Tandospirone
 Thozalinone
 Tianeptine
 Tofenacin
 Toloxatone
 Tranylcypromine
 Trazodone
 Trimipramine
 Venlafaxine
 Viloxazine
 Zimeldine

Antidiabetic

Acarbose
 Acetohexamide
 Bufornin
 Butoxamine
 Carbutamide
 Chlorpropamide
 Epalrestat
 Glibenclamide
 Glibornuride
 Gliclazide
 Glimepiride
 Glipizide
 Gliquidone
 Glymidine Sodium
 Insulin
 Metformin
 Miglitol
 Nateglinide
 Phenformin
 Pioglitazone
 Repaglinide
 Rosiglitazone
 Tiagabine
 Tolazamide
 Tolbutamide
 Tolrestat
 Troglitazone
 Voglibose

Antidiarrhoeal

Loperamide

Antidote (Barbiturate Poisoning)

Bemegride

Antidote (Nerve Gas and Organophosphate Insecticide Poisoning)

Pralidoxime Chloride

Antidote (Organophosphate Insecticide Poisoning)

Obidoxime Chloride

Antidote (Parametamol)

Acetylcysteine

Antiemetic

Benzquinamide
 Cyclizine
 Difenedol
 Dolasetron
 Embramine
 Granisetron
 Metoclopramide
 Metopimazine
 Nabilone
 Ondansetron
 Pipamazine
 Ramosetron
 Thiethylperazine
 Triflupromazine
 Tropisetron
 Δ^9 -Tetrahydrocannabinol

Antiepileptic

Lamotrigine
 Levetiracetam
 Losigamone
 Pregabalin
 Topiramate
 Valproic Acid
 Vigabatrin

Antifilarial

Diethylcarbamazine

Antifungal

Amphotericin B
 Citronella Oil
 Dequalinium Chloride
 Fluconazole
 Flucytosine
 Griseofulvin
 Hydroxystilbamidine
 Ketoconazole
 Miconazole
 Nifuroxime
 Terbinafine
 Xenysalate

Antifungal (Veterinary)

Etisazole

Antiglaucoma

Acetazolamide
 Apraclonidine
 Dorzolamide

Antigonadotropic (Veterinary)

Mibolerone

Antihistamine

Acrivastine
 Alimemazine
 Antazoline
 Astemizole
 Azatadine
 Bamipine
 Bromazine
 Brompheniramine
 Buclizine
 Carbinoxamine
 Cetoxime
 Chlorcyclizine
 Chloropyramine
 Chloropyrilene
 Chlorphenamine
 Cinnarizine
 Clemastine
 Clemizole
 Cyclizine
 Cyproheptadine
 Deptropine
 Desloratadine
 Dexbrompheniramine
 Dexchlorphenamine
 Dimenhydrinate
 Dimetindene
 Dimetotiazine
 Diphenazoline
 Diphenhydramine
 Diphenylpyraline
 Doxylamine
 Ebastine
 Embramine
 Emedastine
 Epinastine
 Fexofenadine
 Histapyrrodine
 Homochlorcyclizine

 Pheniramine
 Phenytoxamine
 Promethazine
 Propiomazine
 Pyrrobutamine
 Thenalidine
 Thenyldiamine
 Thiazinamium Metilsulfate
 Thonzylamine
 Tolpropamine
 Trimethobenzamide
 Tripelennamine
 Triprolidine

Antihistamine (Non-sedating)

Loratadine

Antihistamine (Sedating)

Pizotifen

Antihistamine (Topical)

Levocabastine

Antihypercalcaemic

Gallium Nitrate

Antihyperlipidaemic

Colesevelam Hydrochloride
 Ezetimibe
 Fenofibrate
 Rosuvastatin
 Simvastatin

Antihyperlipoproteinaemic

Fluvastatin
 Lovastatin
 Pravastatin

Antihyperparathyroid

Doxercalciferol
 Maxacalcitol

Antihypertensive

Alacepril
 Amosulalol
 Azamethonium Bromide
 Benazepril
 Benzthiazide
 Bethanidine
 Bopindolol
 Bretylium Tosilate
 Bunazosin
 Cadralazine
 Captopril
 Chlorisondamine Chloride
 Cicletanin
 Clonidine
 Clopamide
 Debrisoquine
 Delapril
 Deserpidine
 Diazoxide
 Dihydralazine
 Diltiazem

Nitrovasodilator

Nicorandil

Nootropic

Donepezil

Peristaltic Stimulant

Cisapride

Progestational Steroid

Chlormadinone Acetate
 Dimethisterone
 Dydrogesterone
 Elcometrine
 Ethisterone
 Etynodiol Diacetate
 Gestonorone Caproate
 Hydroxyprogesterone
 Lynestrenol
 Medroxyprogesterone Acetate
 Megestrol Acetate
 Norelgestromin
 Norethisterone
 Noretynodrel
 Progesterone

Progestational Steroid (Veterinary)

Flugestone

Psychomimetic

Cannabis

Psychostimulant

Bromantane
 Carphedon

Pulmonary Surfactant

Calfactant
 Pumactant

Purgative

Aloin
 Arecoline
 Bisacodyl
 Dantron
 Oxyphenisatine
 Phenolphthalein

Quinolone Antibiotic

Ofloxacin

Respiratory Stimulant

Amiphenazole
 Cropropamide
 Crotetamide
 Dimeflin
 Doxapram
 Etamivan
 Lobeline
 Nikethamide
 Pentetrazol
 Picrotoxin

Rifamycin Antibiotic

Rifabutin

Rubefacient

Camphor

Teclotiazide
 Thurfyl Nicotinate

Rubefacient (Topical)

Benzyl Nicotinate

Sclerosing Agent

Monoethanolamine

Sedative

Acecarbromal
 Alimemazine
 Allobarbitol
 Aprobarbitol
 Apronal
 Barbitol
 Brallobarbitol
 Bromisoval
 Brotizolam
 Butalbitol
 Chloral Betaine
 Chloral Hydrate
 Cinolazepam
 Clomethiazole
 Cyclopentobarbitol
 Dexmedetomidine
 Dichloralphenazone
 Eszopiclone
 Heptabarb
 Hexobarbitol
 Loprazolam
 Methaqualone
 Methylpentynol
 Methylphenobarbitol
 Nealarbitol
 Paraldehyde
 Phenobarbitol
 Propiomazine
 Quazepam
 Ramelteon
 Secbutabarbitol
 Talbutal
 Triclofos Sodium
 Vinbarbitol
 Zaleplon

Sedative (Veterinary)

Metomidate
 Xylazine

Skeletal Muscle Relaxant

Atracurium
 Botulinum Toxin
 Carisoprodol
 Cinolazepam
 Cisatracurium
 Cyclobenzaprine
 Phenprobamate

Tetracyclic Antidepressant

Maprotiline

Thrombolytic

Duteplase
 Lepirudin

Nateplase
 Reteplase

Thyroid Agent

Levothyroxine
 Liothyronine
 Taltirelin

Tranquilliser

Acepromazine
 Acetophenazine
 Azacyclonol
 Benzoctamine
 Bromazepam
 Butaperazine
 Camazepam
 Captodiame
 Carfenazine
 Chlordiazepoxide
 Chlormezanone
 Chlorpromazine
 Chlorprothixene
 Clobazam
 Clopenthixol
 Clorazepic Acid
 Clotiapine
 Demoxepam
 Diazepam
 Dixyrazine
 Droperidol
 Emylcamate
 Ethomoxane
 Ethylisobutrazine
 Fluanisone
 Flupentixol
 Fluphenazine
 Fluspirilene
 Hydroxyphenamate
 Hydroxyzine
 Ketazolam
 Levomepromazine
 Lithium Carbonate
 Lorazepam
 Loxapine
 Mebutamate
 Medazepam
 Meprobamate
 Mesoridazine
 Methoxypropazine
 Molindone
 Nordazepam
 Oxazepam
 Oxyptine
 Pecazine
 Penfluridol
 Perazine
 Pericyazine
 Perphenazine
 Phenaglycodol
 Phenprobamate
 Pimozide
 Pipamperone
 Piperacetazine
 Pipethanate
 Pipotiazine
 Prazepam
 Prochlorperazine
 Promazine
 Prothipendyl
 Sulforidazine
 Sulpiride
 Tetrabenazine

Tetrazepam
Thiopropazate
Thiopropazine
Thioridazine
Tiotixene
Trifluoperazine
Trifluoperidol
Triflupromazine
Trimetozine
Tybamate

Tranquilliser (Veterinary)

Azaperone
Trifluomeprazine

Treatment of ADHD

Atomoxetine
Methylphenidate

Treatment of Acidosis

Trometamol

Treatment of Acute Myocardial Infarction

Retepase

Treatment of Alcohol Poisoning

Metadoxine

Treatment of Alzheimers Disease

Galantamine
Memantine

Treatment of Amnesia

Carphedon

Treatment of BPH

Dutasteride
Finasteride
Naftopidil
Tamsulosin

Treatment of Cardiac Insufficiency

Sparteine

Treatment of ED

Sildenafil
Tadalafil
Vardenafil

Treatment of Endometriosis

Nafarelin

Treatment of Gastric Ulcers

Pirenzepine

Treatment of Hypochlorhydria

Betaine

Treatment of Irritable Bowel Syndrome

Tegaserod

Treatment of Migraine

Dihydroergotamine

Treatment of Peptic Ulcer

Carbenoxolone

Treatment of Urinary Incontinence

Duloxetine
Oxybutynin

Triazole Antifungal

Itraconazole

Tricyclic Antidepressant

Amineptine
Amitriptyline
Amoxapine
Butriptyline
Lofepamine
Protriptyline

Trypanocide (Veterinary)

Homidium Bromide
Isometamidium
Pyritidium Bromide
Quinapyramine

Tuberculostatic

Cycloserine
Isoniazid
Morinamide
Phthivazid
Protionamide
Pyrazinamide
Rifampicin
Salinazid
Thioacetazone
Tioarlide
Viomycin

Ulcer-healing Drug

Nizatidine

Uricosuric

Benzbromarone
Benziodarone
Etebenecid
Probenecid
Sulfinpyrazone

Uterine Stimulant

Methylergometrine

Vasoconstrictor

Nordefrin

Vasodilator

Alprostadiol
Amotriphene
Azapetine
Bamethan
Benziodarone
Betahistine
Buphenine
Butalamine
Codergocrine Mesilate
Cyclandelate
Enoximone
Fasudil
Heptaminol
Inositol Nicotinate
Isoxsuprine
Moxisylyte
Naftidrofuryl Oxalate
Nicametate
Nicergoline
Nicoferanose
Nicotinic Acid
Nicotinyl Alcohol
Pentifylline
Pentoxifylline
Sildenafil
Tolazoline
Xantinol Nicotinate

Vasodilator (Coronary)

Cloricromen
Erythrityl Tetranitrate

Vasodilator (Topical)

Butoxyethyl Nicotinate
Ethyl Nicotinate
Hexyl Nicotinate
Methyl Nicotinate

Xanthine Bronchodilator

Acefylline Piperazine
Bufylline
Caffeine
Diprophylline
Etamiphylline
Etofylline
Proxiphylline
Theophylline

4 Functional Classes: Pesticides

Acaricide

Aldicarb
Azinphos-(Et)
Azinphos-(Me)
Benzyl Benzoate
Chlorpyrifos
Crotamiton
Dioxathion
Fenthion
Methamidophos
Monocrotophos
Naled
Omethoate
Triazophos

Aid to Smoking Cessation

Nicotine

Anaplasmodastat (Veterinary)

Gloxazone

Anthelmintic

Cambendazole
Dithiazanine Iodide
Naphthalene
Tetrachloroethylene

Anthelmintic (Veterinary)

Albendazole
Bunamidine
Carbon Tetrachloride
Clioquinide
Diamfenetide
Haloxon
Methyridine
Morantel
Nitroxinil
Oxyclozanide
Parbendazole
Phenothiazine
Rafoxanide
Resorantel
Tetramisole
Thenium Closilate

Antibacterial

Bacitracin
Cefixime
Chlorquinaldol
Dibrompropamidine
Diminazene
Hydroxyquinoline
Mafenide
Metronidazole

Nitrofurazone
Noxytiolin
Propamidine
Sulfacetamide

Antibacterial (Topical)

Mupirocin

Antibacterial (Urinary)

Mandelic Acid
Methenamine
Nalidixic Acid
Nitrofurantoin
Nitroxoline

Antibacterial (Veterinary)

Furaltadone
Tilmicosin

Antifungal

Buclosamide
Chlorphenesin
Chlorquinaldol
Clodantoin
Clotrimazole
Diamthazole
Dibrompropamidine
Econazole
Fenticlor
Hydroxyquinoline
Natamycin
Noxytiolin
Nystatin
Propamidine
Tolnaftate

Antifungal (Veterinary)

Etisazole

Antimicrobial

Hexetidine

Antiprotozoal

Broxyquinoline
Diminazene
Metronidazole

Antiprotozoal (Veterinary)

Amicarbalide
Aminonitrothiazole
Dimetridazole

Sulfiram

Pesticide

Chloronitrotoluene

Pyrethroid Insecticide

Cyfluthrin

Rodenticide

Alphachloralose
Coumatetralyl
Diphenadione
Fluoroacetamide
Fluoroacetic Acid
Hydrogen Cyanide
Norbormide
Warfarin

Scabicide

Pyrethrum

Trypanocide (Veterinary)

Homidium Bromide
Isometamidium
Pyritidium Bromide
Quinapyramine

5 Functional Classes: Other Substances

1,4-Benzodiazepine

Alprazolam
Chlorazepic Acid
Chlordiazepoxide
Flumazenil
Ketazolam
Medazepam
Metaclazepam
Quazepam
Triazolam

2-Azetidinone

Ezetimibe

5-HT Receptor Antagonist

Cyproheptadine

5-HT Receptor Releasing Agent

Methoxymetamphetamine
Methylthioamphetamine

5-HT₁ Receptor Agonist

Aripiprazole
Eletriptan
Naftopidil
Rizatriptan
Sumatriptan
Trifluoromethylphenylpiperazine
Zolmitriptan

5-HT₂ Receptor Agonist

2C-T-7

5-HT₂ Receptor Antagonist

Nefazodone

5-HT_{2A} Receptor Agonist

2C-T-2

5-HT_{2A} Receptor Antagonist

2C-B
Aripiprazole
Ketanserin

5-HT_{2C} Receptor Agonist

m-Chlorophenylpiperazine

5-HT₃ Receptor Antagonist

Dolasetron
Ondansetron

Ramosetron
Tropisetron

5 α -HT₄ Partial Agonist

Tegaserod

5 α -Reductase Inhibitor

Dutasteride
Finasteride

12,13-Epoxytrichothecene

Diacetoxyscirpenol
Fusarenone-X

ACE Inhibitor

Alacepril
Benazepril
Cilazapril
Delapril
Fosinopril

Acetamide

Dimevamide
Etymide
Oxiracetam
Pramiracetam

Acid

Acetic Acid Glacial
Formic Acid
Hydrochloric
Sulfuric
Nitric Acid

Adenosine α_1 Antagonist

Bamifylline
Propentofylline

Aerosol Propellant

Cryofluorane
Dichlorodifluoromethane
Trichlorofluoromethane

Alcohol Dehydrogenase Inhibitor

Fomepizole

Alcohol Denaturant

Denatonium Benzoate

Alcohol Deterrent

Acamprosate Calcium
Disulfiram

Aldehyde

Acetaldehyde
Acrolein

Aldosterone Antagonist

Drospirenone

Alkaloid

Aconitine
Apoatropine
Benzoylecgonine
Berberine
Chelidonium
Coniine
Cytisine
Ecgonine
Harman
Hydrastine
Hydrastinine

8 Colour Tests

The following table was extracted from a collection of data kindly provided by Professor George Maylin, Cornell University, USA, and gives compound-specific colour reactions from a series of spray reagents applied to thin-layer chromatography systems TA, TE, TAJ, TAK, TAL and TAM.

Name	D	N	C-H	M	FES	NIN	Gibb's	H ⁺ :EtOH	ME	F	I ₂

12 Ultraviolet Absorption Data

In the following tables no values below 190 nm have been included although some have been recorded in the monographs. Details of A (1%, 1 cm) values are given in the monographs.

Table A gives the wavelengths of maximum absorption, together with the wavelengths of any subsidiary peaks in the range 230–360 nm, for the compounds in **acid** solution. Table B gives the wavelengths of maximum absorption in **alkaline** solution when values in acid solution are not recorded in the monographs, or when the values in alkaline solution differ significantly from

the values in acid solution. Table C gives the values in **neutral** solution for compounds for which values in acid or alkaline solution are not recorded in the monographs, or when the values in neutral solution differ significantly from these in acid or alkaline solution.

For an unknown compound, the wavelength of maximum absorption should be compared with the tables using a tolerance of ± 2 nm to give a list of possible compounds; reference may then be made to the monographs.

A. In acid solution—wavelengths of maximum absorption from 192 nm

λ_{max} nm	Compound	Subsidiary Peaks nm	λ_{max} nm	Compound	Subsidiary Peaks nm

B. In alkali solution—wavelengths of maximum absorption

In this table wavelengths of maximum absorption in alkaline solution are given only for those compounds for which maxima in acid solution are not recorded in the monographs, or for which the maxima in alkaline solution differ significantly from the maxima in acid solution.

C. In neutral solution—wavelengths of maximum absorption

The compounds listed below are those whose wavelengths of maximum absorption in acid or alkaline solution are not given in the monographs, or for which the maxima in neutral solution differ significantly from those in acid or alkaline solution.

Dieldrin	Thiotepa
Diethylcarbamazine	Tobramycin
Diethyltoluamide	Tosylchloramide Sodium
Dihydrostreptomycin	Tuaminoheptane
Dimercaprol	Tybamate

13 Infrared Peaks

The table below lists the 6 major absorption bands which have been selected from recorded spectra over the range 3500 to 450 cm^{-1} (5–15 μm). The selected peaks are the 6 most intense peaks, except that peaks in the region where Nujol absorbs (1490–1320 cm^{-1} , 6.7–7.6 μm) have been omitted. The peaks are arranged in descending order of amplitude. Shoulders have been chosen only if they are clearly resolved and the point of maximum absorption can be easily determined. Where there is more than one peak of the same intensity at the sixth intensity level, the choice has been arbitrary. It should be noted that, because of variations in instruments and conditions, other determinations of the spectrum may not give peaks with the same relative intensities. In particular, the order of the 2 most

intense peaks may be reversed and this should be taken into consideration when using the index.

To identify an unknown compound, the wavenumbers of the 2 most intense peaks should be compared with the table, initially allowing a tolerance of $\pm 4 \text{ cm}^{-1}$, to produce a list of possible compounds. Comparison of the six most intense peaks with this list may allow a tentative identification; reference should then be made to the spectra given in the monographs.

If a tentative identification cannot be made, it may be necessary to use a wider coverage, or to search on the third most intense peak.

14 Mass Spectral Data of Drugs

In the following table the *m/z* values of the eight most intense ions are listed in descending order of intensity for drugs and other compounds of forensic interest. To identify an unknown compound, the *m/z* values of the two most intense ions should be compared with the table in order to produce a list of possible

compounds. The eight most intense ions of the unknown can then be compared with this list. Comparison with standard spectra should then be made. Complete mass spectra for most compounds can be found in the monographs.

15 Mass Spectral Data of Pesticides

In the following table the m/z values of the eight most intense ions are listed in descending order of intensity; the table should be used as described under Mass Spectral Data of Drugs.

The values for m/z in this table were obtained using a quadrupole spectrometer, after gas chromatography unless otherwise stated, except for those substances marked the data for which were obtained on a magnetic sector instrument.

Principal peaks at m/z								Compound
30	43	72	102	73	42	118	99	Diminazene
41	132	102	160	96	29	27	44	Propamidine
42	140	112	41	85	43	71	141	Methenamine
43	57	41	55	71	69	56	70	Trichloropheno-xyacetic Acid (isooctil ester)

16 Reagents

Acetate Buffer (pH 5): dissolve 13.6 g of sodium acetate and 6 mL of acetic acid in sufficient water to produce 1000 mL.

Acetic Acid: Glacial Acetic Acid: contains not less than 99% w/w of $\text{CH}_3 \cdot \text{CO}_2\text{H}$.

Acetic Acid, Dilute: contains approximately 6% w/w of $\text{CH}_3 \cdot \text{CO}_2\text{H}$.

Ammonia Buffer (pH 9.5): dissolve 10.7 g of ammonium chloride in 40 mL of 5 mol/L ammonia and dilute with water to 1000 mL.

Ammonia Solution, Dilute: dilute 37.5 mL of strong ammonia solution to 100 mL with water. It contains about 10% w/w of NH_3 .

Ammonia Solution, Strong: contains 27 to 30% w/w of NH_3 .

Ammonium Polysulfide Solution: dissolve a sufficient quantity of precipitated sulfur in ammonium sulfide solution to produce a deep orange solution.

Ammonium Sulfide Solution: saturate 120 mL of 5 mol/L ammonia with washed hydrogen sulfide and add 80 mL of 5 mol/L ammonia. It should be recently prepared.

***p*-Anisaldehyde Reagent:** dissolve 0.5 mL of *p*-anisaldehyde in 50 mL of acetic acid and 1 mL of hydrochloric acid.

Ascorbic Acid Reagent: a 2% solution of ascorbic acid.

Barium Chloride Solution: a 10% solution of barium chloride.

Benzalkonium Chloride Solution: a solution containing 50% of a mixture of alkylbenzyltrimethylammonium chlorides.

Borax Buffer 0.05 mol/L: dissolve 19.07 g of borax in sufficient water to produce 1000 mL.

Bratton-Marshall Spray: (a) 1% sodium nitrite (w/v) in 1% sulfuric acid (v/v). (Add 1.0 g sodium nitrite to 1.0 mL concentrated sulfuric acid in 99 mL water. Store in refrigerator); (b) 5% ammonium sulfamate (w/v) in water. (Add 5.0 g ammonium sulfamate to 100 mL water. Store in refrigerator); (c) 2% *N*-(1-Naphthyl) ethylenediamine dihydrochloride in ethanol (95%). (Add 2.0 g *N*-(1-naphthyl) ethylenediamine dihydrochloride to 100 mL ethanol (95%). Store in refrigerator in brown bottle); (d) Spray in sequence a + b + c; (e) Spray with concentrated HCl; (f) Heat plate in oven at 125° for 10 min

Bromine Solution (Bromine Water): a freshly-prepared, saturated solution of bromine.

Chlorine Solution: a freshly-prepared, saturated solution of chlorine.

Chromic Acid Solution: dissolve 3 g of potassium dichromate in 10 mL of water, then carefully dilute to 100 mL with sulfuric acid with continuous stirring. The solution is stable for one month.

Cobalt Thiocyanate Solution: dissolve 6 g of cobalt nitrate and 18 g of potassium thiocyanate in 100 mL of water.

Copper Sulfate Solution: a 5% solution of copper sulfate.

Cupric Chloride: Dissolve 125 g cupric chloride in 375 mL water and 125 mL methanol.

Dimethyl Yellow Solution: a 0.2% solution of dimethyl yellow in ethanol (90%).

Dithiobisnitrobenzoic Acid Solution: dissolve 10 mg of 5,5'-dithiobis-2-nitrobenzoic acid in 100 mL of phosphate buffer (pH 7.4).

DPST Solution: dissolve 0.5 g of 2,5-diphenyl-3-(4-styrylphenyl)-tetrazolium chloride in 100 mL of ethanol; dilute 5 mL of this solution to 50 mL with 2 mol/L sodium hydroxide immediately before use.

Dragendorff Spray: (a) mix together 2 g of bismuth subnitrate, 25 mL of acetic acid, and 100 mL of water; (b) dissolve 40 g of potassium iodide in 100 mL of water. Mix together 10 mL of (a), 10 mL of (b), 20 mL of acetic acid, and 100 mL of water. Prepare every 2 days.

Duquenois Reagent: dissolve 2 g of vanillin and 0.3 mL of acetaldehyde in 100 mL of ethanol. The reagent should be stored in the dark.

Fast Blue B Solution: a 1% solution of fast blue B salt (diazotised *o*-dianisidine). It should be freshly prepared.

Fearons Reagent: Dissolve 0.5 g pentacyanoamine ferroate (ammonium disodium salt) in 60 mL 5% sodium hydroxide. Add 3 drops of 3% hydrogen peroxide.

Ferric Ammonium Sulfate Solution: a 10% solution of ferric ammonium sulfate.

Ferric Chloride, Ethanol, Sulfuric Acid: Dissolve 500 mg ferric chloride in 150 mL ethanol and 50 mL concentrated sulfuric acid. DANGER: exothermic reaction. Add acid to ethanol with cooling and stirring.

Ferric Chloride Solution: a 5% solution of ferric chloride.

Fluorescamine: Dissolve 50 mg fluorescamine in 100 mL methanol.

Fluorescein Solution: mix 10 mL of a saturated solution of fluorescein in acetic acid with 15 mL of acetic acid and 25 mL of strong hydrogen peroxide solution. This solution must be freshly prepared.

Formaldehyde Solution: Formalin: contains 34–38% w/w of formaldehyde.

Forrest Reagent: mix together equal volumes of a 0.2% solution of potassium dichromate, a 30% v/v solution of sulfuric acid, a 20% w/w solution of perchloric acid, and a 50% v/v solution of nitric acid.

FPN Reagent: mix together 5 mL of ferric chloride solution, 45 mL of a 20% w/w solution of perchloric acid, and 50 mL of a 50% v/v solution of nitric acid.

Furfuraldehyde Reagent: (a) dilute 2 mL of redistilled furfuraldehyde to 100 mL with acetone; (b) dilute 4 mL of sulfuric acid to 100 mL with acetone; prepare immediately before use. Spray with (a) first, followed by (b).

Furfuraldehyde Solution: a 10% solution of furfuraldehyde in ethanol.

Gibbs Reagent: Dissolve 500 mg 2,6-dichloroquinone-4-chloroimide in 100 mL ethanol.

Hydriodic Acid: contains about 55% w/w of HI.

Hydrochloric Acid: Concentrated: contains 35–39% w/w of HCl.

Hydrochloric Acid, Dilute: mix 274 g of hydrochloric acid with 726 g of water. It contains about 10% w/w of HCl.

Hydrogen Peroxide Solution, Strong: 100 volume: contains 29–31% w/v of H_2O_2 .

Hydroxylamine Hydrochloride Solution: dissolve 3.5 g of hydroxylamine hydrochloride in 95 mL of ethanol (60%), add 0.5 mL of a 0.1% solution of bromophenol blue followed by 0.5 mol/L potassium hydroxide in ethanol until a green tint develops in the solution, then add sufficient ethanol (60%) to produce 100 mL.

Iodine Solution: dissolve 2 g of iodine and 3 g of potassium iodide in sufficient water to produce 100 mL.

Iodobismuthous Acid Solution: mix 40 mg of bismuth subcarbonate with 0.5 mL of 0.5 mol/L sulfuric acid and add 5 mL of a 10% solution of potassium iodide, 1 mL of 0.5 mol/L sulfuric acid, and 25 mL of water.

Iodoplatinate Solution: dissolve 0.25 g of platonic chloride and 5 g of potassium iodide in sufficient water to produce 100 mL.

Iodoplatinate Solution, Acidified: add 5 mL of hydrochloric acid to 100 mL of iodoplatinate solution.

Lead Acetate Paper: immerse white filter paper in a mixture of 10 volumes of lead acetate solution and 1 volume of 2 mol/L acetic acid. After drying, cut the paper into strips. Store in a well-closed container.

Lead Acetate Solution: a 10% solution of lead acetate in carbon dioxide-free water.

Ludy Tenger Reagent: dissolve 5 g of bismuth subcarbonate in 15 mL of hydrochloric acid, add 30 g of potassium iodide and then add 85 mL of water very slowly and with constant stirring. For use as a TLC spray, dilute 1 volume with 4 volumes of water.

Mandelins Reagent: dissolve 0.5 g of ammonium vanadate in 1.5 mL of water and dilute to 100 mL with sulfuric acid. Filter the solution through glass wool.

Marquis Reagent: mix 1 mL of formaldehyde solution with 9 mL of sulfuric acid. Prepare daily.

Mercuric Chloride-Diphenylcarbazone Reagent: (a) dissolve 0.1 g of diphenylcarbazone in 50 mL of ethanol; (b) dissolve 1 g of mercuric chloride in 50 mL of ethanol; prepare the solutions daily. Mix (a) and (b) just before spraying.

Mercuric Nitrate Solution: dissolve 40 g of mercuric oxide (red or yellow) in a mixture of 32 mL of nitric acid and 15 mL of water. Store in glass containers protected from light.

Mercurous Nitrate Spray: a saturated solution of mercurous nitrate.

Mercuric Sulfate: Dissolve 4 g mercuric nitrate in 50 mL concentrated sulfuric acid: water (1 : 1). Make up to 250 mL with water.

Molybdate-Antimony Reagent: dissolve 10 g of ammonium molybdate in 40 mL of 2 mol/L sulfuric acid; dissolve 0.1 g of sodium antimony tartrate in 50 mL of 2 mol/L sulfuric acid. Mix the two solutions and dilute to 500 mL with 2 mol/L sulfuric acid.

Naphthoquinone Sulfonate Solution: dissolve 0.3 g of sodium 1,2-naphthoquinone-4-sulfonate in 100 mL of ethanol:water (1:1).

***N*-(1-Naphthyl)ethylenediamine Solution:** a 0.5% solution of *N*-(1-naphthyl)ethylenediamine hydrochloride.

Ninhydrin Spray: add 0.5 g of ninhydrin to 10 mL of hydrochloric acid and dilute to 100 mL with acetone. Prepare daily.

Nitric Acid: Concentrated: contains 69–71% w/w of HNO₃.

Nitric Acid, Dilute: mix 106 mL of nitric acid with sufficient water to produce 1000 mL. It contains about 10% w/w of HNO₃.

Nitric Acid, Fuming: contains not less than 95% w/w of HNO₃.

Nitrogen Dioxide Vapour: produced by the action of nitric acid on copper turnings. For location in thin-layer chromatography the TLC plate is exposed to the nitrous fumes which are evolved.

Nitroso-naphthol Solution: a 0.2% solution of 2-nitroso-1-naphthol in ethanol.

Perchloric Acid: contains about 72% w/w of HClO₄.

Perchloric Acid Solution: add 15 mL of perchloric acid to sufficient water to produce 100 mL.

Phosphate Buffer (pH 5.6): dissolve 62.4 g of sodium dihydrogen phosphate in sufficient water to produce 100 mL.

Phosphate Buffer (pH 6.88): dissolve 3.40 g (0.025 mol/L) of potassium dihydrogen phosphate and 3.53 g (0.025 mol/L) of anhydrous disodium hydrogen phosphate, both previously dried at 110° to 130° for 2 hours, in sufficient water to produce 1000 mL.

Phosphate Buffer (pH 7.4): (a) dissolve 9.465 g of anhydrous disodium hydrogen phosphate in water and dilute to 1000 mL; (b) dissolve 9.073 g of potassium dihydrogen phosphate in water and dilute to 1000 mL. Mix 80 mL of (a) with 20 mL of (b) to obtain a solution of pH 7.4.

Phosphoric Acid: contains 84 to 90% w/w of H₃PO₄.

Potassium Cupri-tartrate Solution: Fehlings Solution: (a) dissolve 34.64 g of copper sulfate in a mixture of 0.5 mL of sulfuric acid and sufficient water to produce 500 mL; (b) dissolve 176 g of sodium potassium tartrate and 77 g of sodium hydroxide in sufficient water to produce 500 mL. Mix equal volumes of solutions (a) and (b) immediately before use.

Potassium Cyanide Solution: a 10% solution of potassium cyanide.

Potassium Permanganate Solution, Acidified: a 1% solution of potassium permanganate in 0.25 M sulfuric acid.

Silver Nitrate Solution: a freshly-prepared 5% solution of silver nitrate.

Sodium Chloride-Potassium Chloride Solution: mix 140 mL of mol/L sodium chloride with 50 mL of 0.1 mol/L potassium chloride, and dilute with water to 1000 mL.

Sodium Hydroxide Solution: a 20% solution of sodium hydroxide.

Sodium Hydroxide Solution, Dilute: a 5% solution of sodium hydroxide.

Sodium Hypobromite Solution: dissolve 5 mL of bromine in 50 mL of a 40% solution of sodium hydroxide, with agitation and cooling.

Starch-iodide Paper: impregnate unglazed white paper with starch mucilage diluted with an equal volume of a 0.4% solution of potassium iodide.

Starch Mucilage: triturate 0.5 g of starch with 5 mL of water and add this, with constant stirring, to sufficient water to produce about 100 mL. Boil for a few minutes, cool, and filter. It should be freshly prepared.

Sulfuric Acid: Concentrated: contains not less than 95% w/w of H₂SO₄.

Sulfuric Acid, Dilute: mix carefully 104 g of sulfuric acid with 896 g of water and cool. It contains about 10% w/w of H₂SO₄.

Sulfuric Acid, Fuming: Oleum: prepared by the addition of sulfur trioxide to sulfuric acid and is available containing about 30% of free SO₃.

Sulfuric Acid-Ethanol Reagent: add gradually 10 mL of sulfuric acid to 90 mL of ethanol.

Tetrabutylammonium Phosphate, 0.005 mol/L, pH 7.5: PIC Reagent A. Marketed by Waters Associates Inc., Milford, MA 01757, USA; Waters Associates (Instruments) Ltd, Northwich, Cheshire, UK.

***p*-Toluenesulfonic Acid Solution:** dissolve 4 g of *p*-toluenesulfonic acid in 20 mL of ethanol.

Trinders Reagent: dissolve 40 mg of mercuric chloride in 850 mL of water, add 120 mL of mol/L hydrochloric acid and 40 g of hydrated ferric nitrate, and dilute to 1000 mL with water.

Van Urk Reagent: dissolve 1 g of *p*-dimethylaminobenzaldehyde in 100 mL of ethanol and add 10 mL of hydrochloric acid.

Vanillin: Dissolve 2 g vanillin in 100 mL concentrated sulfuric acid.

Zwickers Reagent: mix 40 mL of a 10% solution of copper sulfate with 10 mL of pyridine and add sufficient water to produce 100 mL.

Proprietary test materials

Amberlite XAD-2: polymeric adsorbent beads for adsorbing water-soluble organic substances. Marketed by Rohm and Haas Company, Philadelphia, PA 19105, USA; Rohm and Haas (UK) Ltd, Croydon, Surrey, UK.

Anabolic Steroid Radioimmunoassay Kits: for nandrolone and for 17 α -methyl substituted anabolic steroids. Obtainable from Prof. R. V. Brooks, Dept of Chemical Pathology, St. Thomas Hospital Medical School, London, UK.

Carbon Monoxide in Blood: Spectrophotometric Reference Standards. Marketed by American Hospital Supply Corporation, Evanston, IL 60201, USA; American Hospital Supply (UK) Ltd, Ashford, Middlesex, UK.

Cholinesterase Activity Assay Kit: colorimetric method for plasma or serum. Marketed by Sigma Chemical Co., St. Louis, MO 63178, USA; Sigma London Chemical Co. Ltd, Poole, Dorset, UK.

Co-oximeter, IL 282: for the determination of carbon monoxide in blood. Marketed by Instrumentation Laboratory Inc., Lexington, MA 02173, USA; Instrumentation Lab. UK Ltd, Warrington, Cheshire, UK.

Dextrostix: reagent strips for the approximate estimation of glucose in blood. Marketed by Ames, Division of Miles Laboratories Inc., Elkhart, IN 46515, USA; Ames Division of Miles Laboratories Ltd, Stoke Poges, Buckinghamshire, UK.

Ethanol Assay Kit: enzymatic method for the determination of ethanol in whole blood, plasma, or serum. Marketed by Sigma Chemical Co., St. Louis, MO 63178, USA; Sigma London Chemical Co. Ltd, Poole, Dorset, UK.

Extrelut: a column containing granules of diatomaceous earth with a large pore volume. Marketed by E. Merck, D-6100 Darmstadt, W. Germany; BDH Chemicals Ltd, Poole, Dorset, UK.

High Performance Silica Gel TLC Plates: with fluorescent indicator and concentration zone. Marketed by E. Merck, D-6100 Darmstadt, W. Germany; BDH Chemicals Ltd, Poole, Dorset, UK.

Labstix: reagent strips for urine testing to indicate pH, and the presence of protein, glucose, ketones, and blood. Marketed by Ames, Division of Miles Laboratories Inc., Elkhart, IN 46515, USA; Ames Division of Miles Laboratories Ltd, Stoke Poges, Buckinghamshire, UK.

Paracetamol Assay Kit: enzymatic method for the determination of paracetamol in plasma. Marketed by Cambridge Life Sciences, Cambridge, UK.

Sephadex LH-20: a bead-formed dextran gel with hydrophilic and lipophilic properties. Marketed by Pharmacia (Great Britain) Ltd, Milton Keynes, Buckinghamshire, UK; Pharmacia Fine Chemicals, Division of Pharmacia Inc., Piscataway, NJ 08854, USA.

Sep-Pak C-18 Cartridge: a silica cartridge for column chromatography. Marketed by Waters Associates Inc., Milford, MA 01757, USA; Waters Associates (Instruments) Ltd, Northwich, Cheshire, UK.

Serum-Iron Assay Kit: Marketed by Travenol Laboratories Inc., Deerfield, IL 60015, USA; Lorne Laboratories Ltd, Reading, Berkshire, UK.

Subtilisin A: Marketed by Novo Enzyme Products Ltd, Windsor, Berkshire, UK.

Tox Elut: a column containing granules of diatomaceous earth with a large pore volume. Marketed by Analytichem International Inc., Lawndale, CA 90260, USA.

Urastrat: a complete quantitative system for the determination of urea nitrogen in serum. Marketed by General Diagnostics, Warner-Lambert (UK) Ltd, Eastleigh, Hampshire, UK.

17 Pharmacological Terms

Abdominal: relating to the abdomen (the part of the body between the pelvis and the chest).

Abscess: a localised collection of pus.

Absorption rate constant: a pharmacokinetic measurement used in describing the distribution of a drug.

Acetoacetylcoenzyme A thiolase: an enzyme that catalyses the synthesis of acetoacetyl coenzyme A from two molecules of acetyl coenzyme A; it can also act as a thiolase, catalysing the reverse reaction.

Acetylation: addition of an acetyl group to a substance.

Acetylcholinesterase: a hydrolase enzyme found in red blood cells and other tissues that catalyses the cleavage of acetylcholine to choline and acetate.

α_1 -Acid glycoprotein: an acute phase protein found in blood plasma that is an indication of tissue necrosis and inflammation.

Acidification of urine: administration of agents, such as ammonium chloride or ascorbic acid, to produce acidic urine.

Acidosis: disturbance of acid–base balance of the body as a result of accumulation of acid and hydrogen ions or depletion of the alkaline reserve.

Acrodynia: *see* Pink disease.

Active metabolite: the pharmacologically active product of metabolism of a drug.

Acute renal failure: kidney failure of sudden onset.

Addiction: state of being physiologically and psychologically dependent on a drug.

Adenosine triphosphate: a nucleotide that occurs in all cells and acts as an energy store and is required for various metabolic reactions, including the synthesis of nucleic acids and proteins, and to produce mechanical movement.

Adipose tissue: fatty tissue.

Adrenal medulla: the inner part of the adrenal gland that synthesises catecholamines.

Adrenergic nervous system: sympathetic nerves that liberate noradrenaline at their synapses.

Adrenocortical insufficiency: reduced secretion of corticosteroids by the adrenal cortex.

Agglutination: the clumping together of red blood cells or micro-organisms that is brought about by specific antibodies called agglutinins.

Agonal: occurring at the time just before death.

Alanine aminotransferase: an enzyme found in the serum and body tissues, especially the liver, that catalyses the reversible transfer of nitrogen (as an amino group) for excretion or for incorporation into other compounds.

Albumin: the main protein in blood plasma.

Alcohol dehydrogenase: an enzyme that catalyses the oxidation of many alcohols to their corresponding aldehyde.

Aleukia: a reduced number of leukocytes (white blood cells) in the blood.

Algal: relating to or caused by algae.

Alkaline phosphatase: an enzyme that in alkaline conditions catalyses the cleavage of orthophosphate from orthophosphoric monoesters.

Alkalinisation of urine: administration of agents, such as potassium citrate or sodium bicarbonate, in order to produce alkaline urine.

Allele: any alternative form of a gene that can occupy a particular chromosomal locus.

Allergen: an agent capable of producing immediate-type hypersensitivity (allergy).

Allergic reaction: an antigen–antibody reaction that causes tissue damage and that is triggered by exposure of a sensitised individual to the particular antigen or allergen.

Alopecia: hair loss.

Alzheimers disease: a form of dementia in which there is diffuse atrophy of the cerebral cortex.

Amanita phalloides: the death cap poisonous mushroom.

Amino acid: any organic compound containing an amino and a carboxyl group.

Aminoglycoside antibiotic: a generic term used for a bactericidal antibiotic that is derived from bacteria of the *Streptomyces* and *Micromonospora* families, such as gentamicin, neomycin, and framycetin.

Aminotransferase: an enzyme that catalyses the transfer of an amino group to another molecule.

Amnesia: partial or total loss of memory.

Amylase: any enzyme that catalyses the conversion of starches into sugars.

Amyotrophic lateral sclerosis: a fatal progressive degenerative disorder that affects the upper and lower motor neurones in the brain and spinal cord.

Anabolic agent: an agent that promotes synthesis of body protein.

Anaemia: a reduction below normal of the blood-haemoglobin concentration due to lack of red blood cells and/or their haemoglobin content.

Anaerobic: occurring in the absence of molecular oxygen.

Anaesthesia: loss of sensation either by nerve or receptor damage or by the administration of an anaesthetic drug.

Anagen: the part of the hair growth cycle during which hair synthesis occurs.

Analgesic: a drug that relieves pain.

Anaphylactic shock: shock due to an allergic reaction.

Anecdotal: based on individual cases rather than on controlled studies.

Angiotensin-converting enzyme inhibitor: an antihypertensive drug that acts by inhibiting angiotensin-converting enzyme and produces vasodilatation and reduces peripheral resistance.

Anhedonia: total loss of interest or enjoyment in former pleasures or activities.

Anorexia: loss or lack of appetite for food.

Anoxia: a total lack of oxygen in the tissues.

Antagonist: an agent that has no effect alone, reverses the effects of agonists.

Antemortem: before death.

Anti-arrhythmic: a drug that is used in the management of cardiac arrhythmias.

Antibiotic: a general term used to encompass all the different antimicrobial drugs.

Antibody: a specific substance produced in the blood as a reaction to an antigen.

Anti-cancer agent: a drug that is used to treat malignant neoplasms (cancers).

Anticoagulant: a drug, such as heparin or warfarin, that inhibits blood clotting and is used in the treatment of thromboembolic disorders.

Anticonvulsant: a drug that is used in the treatment of epilepsy or other convulsive disorders.

Antidepressant: a drug used to treat depression, includes the tricyclic antidepressants and monoamine oxidase inhibitors (MAOIs).

Antidote: a remedy that counteracts the actions of a poison.

Antiepileptic: a drug that reduces the frequency of epileptic seizures.

Antifungal: a drug, such as ketoconazole, that is used to treat fungal infections.

Antigen: a substance that is capable of initiating the production of a specific antibody (immunoglobulin) that reacts with the antigen.

Antihistamine: a drug that antagonises the actions of histamine at H_1 receptors and is used to treat type I hypersensitivity reactions and to alleviate pruritus, nausea and vomiting.

Antihypertensive: a drug that reduces blood pressure.

Anti-inflammatory: a drug that is used to reduce inflammation, includes aspirin, NSAIDs and antirheumatic drugs.

Antiparkinsonian: a drug that stimulates dopamine receptors or enhances the actions of dopamine and is used to treat Parkinsons disease.

Antipsychotic: a drug used in the treatment of psychoses (formerly called a major tranquilliser).

Antiserum: a serum, obtained from an animal that has previously been immunised against an antigen, which contains immunoglobulins against the antigen.

Anti-ulcer: an agent that prevents formation of ulcers or promotes their healing.

Antivenom: a proteinaceous material containing antitoxins that is used as an antidote to poisoning by certain snakes and arthropods.

Antiviral: a drug used in the treatment of a viral infection.

Anxiolytic: a drug that reduces anxiety.

Aorta: the artery that carries blood out of the left ventricle of the heart.

Aphonia: loss of voice.

Aphrodisiac: a drug that arouses sexual excitement.

Apnoea: cessation of breathing.

Arrhythmia: any variation from the normal rhythm of the heartbeat.

Arterial blood: oxygenated blood (bright red in colour).

Arthralgia: pain in a joint.

Aspartate aminotransferase: (aspartate transaminase, AST) an enzyme that catalyses the reversible transfer of an amino group from aspartate to α -ketoglutarate to form glutamate and oxaloacetate.

Asphyxia: cessation of breathing that occurs as a result of hypoxia and hypercapnia induced by breathing air lacking in oxygen.

Aspiration: removal, by suction, of excess fluid or gas from a body cavity (*see also* Gastric aspiration).

Assay: determination of the amount of a particular constituent of a mixture, or determination of the biological or pharmacological potency of a drug.

Asymptomatic: no symptoms.

Ataxia: jerky and irregular movements that are a result of defective muscular control.

Atrial flutter: a cardiac arrhythmia characterised by a rapid atrial rate.

Attention deficit disorder: a childhood mental disorder characterised by inattention and hyperactivity.

AUC: area under the plasma concentration vs time curve.

Autonomic nerves: the parasympathetic and sympathetic nervous systems that control cardiac and smooth muscle and glands.

Autopsy: postmortem examination of a body for determining the cause of death or presence of any pathological changes.

Axon: that part of a neurone that carries impulses away from the cell body.

Barbiturate: a sedative drug derived from barbituric acid.

Benzodiazepine: any of a group of compounds having a common molecular structure and acting similarly as depressants of the central nervous system.

β -blocker: a competitive antagonist at beta-adrenergic receptor sites.

β -glucuronidase: *see* Glucuronidase.

Bezoar: a deposit of foreign hard material in the gastrointestinal or urinary tract.

Bile: a greenish-yellow fluid stored in the gall bladder and secreted by the liver into the small intestines via the bile ducts; its main constituents are bile salts, the bile pigments (bilirubin and biliverdin), and cholesterol.

Biliary excretion: excretion of a drug or metabolite into the bile.

Bilirubin: a yellow bile pigment that is mainly formed from the breakdown of haemoglobin from red blood cells in the spleen. It circulates in plasma as a complex with albumin and undergoes conjugation in the liver to form bilirubin diglucuronide, which is excreted in bile.

Bioavailability: proportion of a drug or foreign compound absorbed.

Bipolar disorder: a mood disorder in which the patient experiences alternating episodes of hypomania or mania and depression.

Blepharospasm: spasm of the muscles in the eyelid that results in the eye being almost completely closed.

Blood: the red viscid fluid that circulates through the heart and blood vessels; it consists of plasma, erythrocytes (red blood cells), leukocytes (white cells) and platelets (thrombocytes).

Blood bank: a special refrigerator used to store blood after withdrawal from donors until required for transfusion.

Blood clot: a semi-solid mass formed mainly of platelets and fibrin.

Blood urea nitrogen: the urea concentration of blood or serum stated in terms of nitrogen content; it is used as an indication of glomerular filtration rate.

Blood-brain barrier: the membranes between the circulating blood and the brain; some drugs can diffuse through these membranes into the cerebrospinal fluid, others cannot.

Bone marrow: the soft material filling the cavities of the bones.

Botulism: neurotoxicity caused by the exotoxin *Clostridium botulinum* usually as a result of eating contaminated food; symptoms include descending paralysis, gastrointestinal disturbances, postural hypotension, dry mouth, and dilated pupils.

Bronchoconstriction: narrowing of the bronchial lumen usually as a result of bronchial smooth muscle contraction.

Buccal: relating to the cheek of the mouth.

Calcineurin phosphatase: a protein phosphatase, specific for serine and threonine, that plays an important role in activation of T lymphocytes.

Cannabinoid: any of the principles that can be extracted from cannabis, including tetrahydrocannabinol, cannabinal, and cannabidiol.

Capillary: one of the minute blood vessels that connect the arterioles and venules.

Carboxyhaemoglobin: haemoglobin in which the oxygen binding sites are occupied by carbon monoxide.

Carcinogen: any cancer-producing substance.

Carcinogenic: a substance able to cause cancer.

Carcinomatosis: a condition in which cancer is disseminated throughout the body.

Cardiac arrest: sudden cessation of the heart beat.

Cardiac arrhythmia: any abnormality in the rate or regularity of the heartbeat.

Cardiac failure: inability of the heart to pump blood at an adequate rate for tissue requirements.

Cardiac glycoside: a drug, such as digoxin, that is used to slow the heart rate in some cardiac arrhythmias and to treat heart failure.

Cardiac infarction (myocardial infarction): interruption of the blood supply to the heart muscle resulting in necrosis.

Cardiorespiratory arrest: stopping of the heart and breathing.

Cardiovascular: relating to the heart and blood vessels.

Catagen: the brief part of the hair growth cycle when anagen (growth) stops and telogen (resting) begins.

Catalepsy: term used in psychiatry to describe maintenance of a fixed body posture.

Catecholamine: any of the amines produced in the body (e.g. noradrenaline and adrenaline) that are involved in nerve transmission in the sympathetic nervous system.

Catecholmethyltransferase: a cytosolic enzyme found in the kidney, liver and central nervous system that catalyses the methylation of a catechol or catecholamine.

Catheterisation: insertion of a catheter (a tubular, flexible surgical instrument) into a body cavity to withdraw or introduce fluid.

Central nervous system (CNS): the part of the nervous system consisting of the brain and spinal cord.

Cerebral haemorrhage: bleeding into the brain.

Cerebrospinal fluid (CSF): the clear fluid filling the ventricles of the brain, the subarachnoid space, and the central canal of the spinal cord.

Cerebrovascular accident: *see* Stroke.

Charcoal haemoperfusion: the extracorporeal removal of toxic substances from the blood using charcoal as an adsorbent.

Chelating agent: an agent, such as desferrioxamine or EDTA, that inhibits a toxin by reacting with it to form a less active or inactive complex.

Chelation therapy: the use of a chelating agent to manage a case of poisoning.

Cholesterol: a sterol found in the brain, nerves, liver, blood, and bile that is the precursor of bile acids and steroid hormones and is also a constituent of cell membranes.

Cholinergic: receptors that are stimulated by acetylcholine.

Cholinesterase: an enzyme found in various tissues, including plasma, that catalyses the hydrolysis of acetylcholine into choline.

Chorea: brief, involuntary muscle contractions and an inability to sustain voluntary contractions.

Chronic interstitial nephritis: chronic inflammation of the interstitial renal tissue that leads to progressive fibrosis and danger of renal failure.

Circulatory collapse: *see* Shock.

Circulatory shock: *see* Shock.

Cirrhosis: damage to cells of an organ resulting in fibrosis (usually applied to the liver).

Clearance: a pharmacokinetic term that usually refers to plasma clearance and is the rate at which plasma is cleared of a substance by processes such as excretion by the kidneys, metabolism, or dialysis.

Clot: a semi-solid mass, as in a clot of blood or lymph.

Clotting factor: one of the substances in the blood (known as factors) that are essential to the clotting process.

CNS depressant: a substance that reduces activity of the central nervous system.

Coagulated blood: blood that has clotted.

Coagulation factor: *see* Clotting factor.

Cognition: the processes in the mind that are involved in perceiving, thinking and remembering.

Colic: acute abdominal pain.

Coma: a state of complete loss of consciousness from which the patient cannot be roused even by powerful stimulation.

Competitive inhibition: reversible binding of a drug that results in inhibition of enzyme activity or antagonism at a receptor site.

Complex partial epilepsy: a seizure with impaired consciousness in which the neuronal discharges remain localised in 1 area of the brain.

Concretion: a deposit of hard material in a natural cavity or in tissue.

Congener: something that is closely related to another thing or shares the same functions.

Conjugation reaction: a type of metabolic reaction that involves the addition of an endogenous group to a drug molecule to produce a more polar substance that is more readily excreted by the body.

Conjunctiva: the delicate transparent membrane that lines the eyelids and covers the exposed part of the eyeball.

Convulsion: involuntary contraction of the voluntary muscles.

Corticosteroid: one of the 21-carbon steroids synthesised by the adrenal cortex which may possess either mainly glucocorticoid actions (effects on carbohydrate, fat and protein metabolism) or mineralocorticoid actions (effects on fluid and electrolyte balance).

Cotinine: the major urinary metabolite of nicotine.

Coumarin anticoagulant: any derivative of coumarin or any compound that acts like coumarin as an indirect anticoagulant, such as warfarin.

Cramp: an involuntary, painful, spasmodic muscle contraction.

Creatine: an amino acid found mainly in skeletal muscle.

Creatinine: a breakdown product of the decomposition of creatine that is excreted in the urine.

Creatinine clearance: renal clearance of endogenous creatinine (commonly used to provide an estimate of glomerular filtration rate).

Cyanosis: a bluish coloration of skin and mucous membranes caused by excessive amounts of deoxyhaemoglobin (reduced haemoglobin) in the blood.

Cyclo-oxygenase-2 inhibitor: a type of non-steroidal anti-inflammatory drug, such as celecoxib, that selectively inhibits the enzyme cyclo-oxygenase-2 and is used in the management of rheumatic disorders.

CYP3A: one of the forms of cytochrome P450.

Cysteine: a sulfur-containing non-essential amino acid produced by the hydrolysis of proteins.

Cytochrome a-a₃ complex: a complex formed in the electron transport chain that transfers electron to oxygen, reducing it to water.

Cytochrome P450: an enzyme found in the cells of most tissues that catalyses a wide range of oxygenation reactions that are responsible for the detoxification of many drugs.

Cytochrome P450 mixed function oxidase: *see* Cytochrome P450.

Cytochrome-P450 IID6: one of the forms of cytochrome P450.

Cytosolic: relating to or contained in the cytosol (liquid medium of the cytoplasm).

Deacetylation: removal of an acetyl group.

Dealkylation: removal of an alkyl group.

Deamination: removal of an amine group.

Deletion: in genetics, the loss of any part of the genetic material on a chromosome.

Delirium: an acute transient mental disturbance that may be characterised by hallucinations or illusions.

Dementia: a deterioration of cognitive processes or intellectual abilities including memory, judgement, language and abstract thinking.

Demethylation: removal of a methyl group.

Dental caries: tooth decay.

Dependency: a state in which there is a compulsive or chronic need, usually for a drug.

Depolarising substance: a substance that reduces the voltage across a biological membrane.

Depressant: a substance that reduces energy and activity by causing muscular relaxation.

Dialysis: a general term used to describe the removal of waste products and excess water from a patient by diffusion through a semi-permeable membrane, examples of specific procedures include peritoneal dialysis and haemodialysis.

Dialysis dementia: a dementia formerly seen in dialysis patients associated with high levels of aluminium in the dialysis fluid or with aluminium-containing antacids given to control phosphorus levels.

Diaphorase: any flavoprotein that catalyses the oxidation of the cofactors NAD or NADP (see below) using a non-physiological compound (such as methylene blue) as an electron acceptor.

Diaphoresis: *see* Sweating.

Diaphragm: the dome-shaped muscular membrane that separates the thorax from the abdomen.

Diarrhoea: increased frequency and liquidity of the stools.

Diffuse intravascular coagulation: *see* Disseminated intravascular coagulopathy.

Diplopia: double vision.

Disseminated intravascular coagulopathy: a bleeding disorder where there is widespread microvascular thrombosis with tissue and organ ischaemia combined with spontaneous bruising and bleeding.

Diuresis: increased production of urine.

Diuretic: an agent that promotes diuresis.

DNA: deoxyribonucleic acid, the primary genetic material of cellular organisms.

Dopamine receptor: one of several types of receptor that are stimulated by the neurotransmitter dopamine.

Drug compliance: the degree to which a patient complies with instructions for taking their prescribed medicines.

Drug conjugate: the product of a drug metabolism reaction in which the drug is combined with another moiety such as a sugar or amino acid.

Drug receptor: *see* Receptor.

Drug tolerance: the requirement for larger doses of a drug to maintain a constant response or a diminution of response to repeated constant doses of a drug.

Duodenal ulcer: a peptic ulcer (a distinct break in the gastro-intestinal mucosa) in the duodenum.

Dysarthria: impaired speech due to loss of muscular control.

Dysautonomia: dysfunction of the autonomic nervous system.

Dysphagia: difficulty in swallowing.

Dysphoria: disquiet, malaise, restlessness.

Dyspnoea: difficulty in or laboured breathing.

Eating disorder: a disorder, such as anorexia nervosa, where an abnormal feeding habit is accompanied by psychological factors.

Eczema: a term used, often synonymously with dermatitis, to refer to a variety of skin conditions characterised by redness, inflammation and itching.

EEG: *see* Electroencephalogram.

Egestion: the casting out of indigestible material.

Electrocardiogram (ECG): a graphic tracing that represents the electrical currents produced by contraction of the heart muscle.

Electroencephalogram (EEG): a recording of the electrical impulses generated by nerve cells in the brain.

Elimination: a pharmacokinetic term used to describe the removal of a drug from the body, for example by metabolism or excretion in urine or faeces.

Elimination rate constant: a pharmacokinetic definition describing the rate of clearance of a drug.

Emesis: *see* Vomiting.

Emetic: an agent that causes vomiting.

Emetic chemoreceptor: the vomiting centre in the brain, stimulation of which produces vomiting.

Emphysema: an abnormal accumulation of air in tissues or organs; often refers to pulmonary emphysema where there is distension of the alveoli of the lungs.

Encephalopathy: degenerative disease of the brain.

Endocytosis: the uptake of a substance by a cell by invagination of its membrane and formation of a vesicle.

Endogenous: arising from causes within the organism.

Endotoxin: a heat-stable toxin associated with the outer membranes of certain gram-negative bacteria that are not secreted by the cells but are only released when the cells are disrupted.

End-stage renal failure: chronic renal failure that is irreversible.

Enterohepatic recirculation: a recycling of a drug/metabolite that can occur if the compound is excreted in the bile and then undergoes metabolism by the gut flora and is reabsorbed and is subject to metabolism in the liver, excretion in the bile, etc.

Enzymatic hydrolysis: the splitting of a compound by the addition of water and facilitated by an enzyme.

Eosinophilia-myalgia syndrome: a syndrome, sometimes fatal, of eosinophilia (increased white blood cells in the blood) combined with severe generalised myalgia that has been reported in patients taking preparations containing tryptophan.

Epidermal: relating to the external layer of the skin.

Epithelium: the tissue covering internal and external surfaces of the body.

Epigastric: referring to the region of the abdomen lying over the stomach.

Epilepsy: a group of syndromes that are characterised by recurrent epileptic seizures; an epileptic seizure is a paroxysmal discharge of cerebral neurones that may manifest as various clinical signs, including impairment or loss of consciousness, abnormal motor phenomena, or sensory or autonomic disturbances.

EPO: *see* Erythropoietin.

Ergotism: poisoning from eating ergotised grain or from misuse of medicinal ergot.

Erythema: reddening of the skin.

Erythrocytes (red blood cells): non-nucleated cells in circulating blood that contain haemoglobin.

Erythropoietin (EPO): a glycoprotein hormone secreted chiefly by the kidney in the adult and by the liver in the fetus, which acts on the bone marrow cells to stimulate red blood cell production; an erythropoietin that is produced by recombinant DNA technology is available for clinical use.

Esterase: an enzyme that catalyses the breakdown of an ester to produce an alcohol and an acid.

Eumelanin: a type of melanin (black pigment) found in darkly coloured skin and hair.

Euphoria: an exaggerated feeling of well-being (physical and mental).

Exogenous: from outside the organism.

Extracellular: outside the cell.

Extrapyramidal: referring to the parts of the central nervous system that are involved in motor activities but which are outside the pyramidal tract.

Extravascular: situated or occurring outside a blood vessel.

F-actin: a polymerised form of actin, a protein that makes up muscle fibres.

Factor V: a clotting factor found in plasma but not in serum that catalyses the cleavage of prothrombin to the active thrombin.

Factor X: a clotting factor that is involved in both the intrinsic and the extrinsic pathways of blood coagulation.

Faeces: the excrement discharged from the intestines consisting of bacteria, cells exfoliated from the intestines, secretions (mainly from the liver) and a small amount of food residue.

Fatty acid: a straight chain monocarboxylic acid that occurs in fats.

Femoral: relating to the femur or thigh.

Ferrochelatase: an enzyme found in mitochondria that catalyses the insertion of ferrous iron into protoporphyrin IX to form haem.

Fetal: relating to the fetus.

Fetus: the postembryonic developing child in utero (i.e. from 9 weeks after fertilisation until birth).

Fever: elevation of the body temperature above normal.

Fibrin: the insoluble protein matrix that forms part of a blood clot and is formed from soluble fibrinogen by the enzymatic action of thrombin.

Fibrinogen: a soluble plasma protein that is converted to insoluble fibrin by the action of thrombin.

First-pass metabolism: metabolism of an orally taken drug that occurs in the gastro-intestinal tract or in the liver before the drug enters the systemic circulation.

Fit: colloquial term for an epileptic seizure.

Flaccid paralysis: a paralysis that is accompanied by loss of muscle tone and absence of tendon reflexes.

Free drug: drug in the bloodstream that is not bound to plasma proteins.

Fresh frozen plasma: a preparation prepared from centrifuged donated whole blood that is used clinically to replace clotting factors or other plasma proteins.

G-actin: a globular form of actin, a protein that makes up muscle fibres.

Gangrene: death of tissue, usually as a result of inadequate blood supply, that is followed by bacterial infection and putrefaction.

Gastric aspiration: inhalation of the stomach contents into the lungs.

Gastric lavage: irrigation of the stomach.

Gastric ulcer: a peptic ulcer (an ulceration of the mucous membrane) occurring in the stomach.

Gastroenteritis: an acute inflammation of the mucous membranes of the stomach and intestines, usually caused by bacterial infection, with symptoms including nausea, diarrhoea, abdominal pain and weakness.

Gene: a segment of a DNA molecule that contains all the information required for synthesis of a product (polypeptide chain or RNA molecule).

Genome: the complete set of hereditary factors as in chromosomes.

Genomics: the study of the structure and function of the genome.

Genotype: the complete genetic constitution of an individual.

Gilberts syndrome: an inborn error of bilirubin metabolism where blood concentration of unconjugated bilirubin is raised but there is no blood abnormality or liver damage.

β -Globulin: one of the globulins present in serum that constitute the majority of plasma protein.

Glomerulopathy: any disease of the glomeruli of the kidneys.

Glomerulus: a functional unit of the kidney that collects the filtrate from the blood capillaries and directs it into the kidney tubule.

Glucocorticosteroid: any of the corticosteroids that regulate carbohydrate, lipid, and protein metabolism.

Gluconeogenesis: synthesis of glucose from protein or fat that occurs when there is insufficient carbohydrate available.

Glucose-6-phosphate dehydrogenase: an enzyme that catalyses the oxidation of glucose-6-phosphate to a lactone, reducing NADP⁺ to NADPH, which in turn maintains levels of reduced glutathione in cells.

Glucuronidase: an enzyme that catalyses the cleavage of terminal glucuronic acid residues from a variety of β -glucuronides; it is present in the intestine where it can hydrolyse glucuronide conjugates and therefore can contribute to the recycling that is seen with some compounds (*see* Enterohepatic recirculation).

Glucuronidation: addition of glucuronic acid to form a conjugate (*see* Glucuronide conjugate).

Glucuronide conjugate: a water-soluble compound formed during metabolism of a drug that is a result of combination with α -D-glucuronic acid.

Glucuronyl transferase: an enzyme that catalyses the transfer of glucuronic acid to a substrate to form a glucuronide conjugate.

Glutathione: a tripeptide, found in many tissues but especially in the liver, which acts as a cofactor for enzymes and also detoxifies harmful compounds.

Glutathione peroxidase: an enzyme found in high levels in the liver that catalyses the detoxifying reduction of peroxides (such as hydrogen peroxide or organic peroxides) via oxidation of glutathione.

Glutathione S-transferase: an enzyme that catalyses the conjugation of a wide variety of substances with glutathione.

Glycosuria: glucose in the urine.

Granuloma: an imprecise term for any small nodule formed by inflammatory cells.

Granulopenia: a reduction in the number of granulocytes (a type of white blood cell) in the blood.

Growth hormone: an anabolic hormone secreted by the pituitary gland that promotes growth of skeletal, muscular and other tissues; a growth hormone produced by recombinant DNA technology is available for clinical use.

Habituation: an older term used in describing drug dependency.

Haem: the iron protoporphyrin group that is the pigment-carrying part of haemoglobin.

Hematocrit: the proportion of the volume of a blood sample that is red blood cells.

Haematuria: blood in the urine.

Haemocyanin: a blue pigment found in the blood plasma of many molluscs and arthropods that can bind oxygen.

Haemodialysis: the removal of waste products from the blood by passing the blood through a dialysis machine.

Haemofiltration: the removal of waste products from the blood by passing the blood through filters outside the body and returning the blood to the patient.

Haemoglobin: the red oxygen-carrying pigment of red blood cells that comprises an iron-containing group called haem combined with globin; it has the ability to reversibly bind oxygen.

Haemolysis: breakdown of red blood cells causing release of haemoglobin.

Haemolytic uraemic syndrome: a syndrome (seen predominantly in children) in which intravascular platelet clumping occurs mainly in the renal vasculature causing renal impairment.

Haemorrhagic colitis: a bloody diarrhoea caused by a strain of *Escherichia coli* that is generally self-limiting but may be complicated by haemolytic uraemic syndrome.

Haemorrhagic diathesis: a predisposition to abnormal clotting and bleeding.

- Haemostatic:** an agent that stops bleeding.
- Hair follicle:** the sheath in which a hair grows.
- Half life (plasma half life):** the time required for the drug plasma concentration to fall to half of a certain measured concentration.
- Hallucination:** a false perception of an object that occurs in the absence of such an object.
- Hallucinogen:** an agent capable of producing hallucinations.
- HCG (human chorionic gonadotrophin):** a hormone produced by the placenta.
- Heart block:** impairment of conduction of the normal sinus node impulse through the heart.
- Heparinised blood:** blood that has had heparin added to it to increase the clotting time.
- Hepatic clearance:** removal of a drug from the blood by metabolism in the liver.
- Hepatic dysfunction:** impaired functioning of the liver.
- Hepatic encephalopathy:** a degenerative disease of the brain that usually occurs as a consequence of advanced liver disease; disturbances of consciousness occur that may progress to coma.
- Hepatic failure:** liver failure.
- Hepatic portal system:** the blood supply of the liver.
- Hepatitis:** inflammation of the liver.
- Hepatobiliary:** affecting the liver and the bile or bile ducts.
- Hepatocellular carcinoma:** cancer of the liver cells.
- Hepatocyte:** a liver cell.
- Hepatolenticular degeneration:** a rare autosomal disease of impaired excretion of excess copper which leads to copper accumulation in the liver, brain and other organs including the kidneys and corneas; also known as Wilsons disease.
- Hepatorenal:** relating to the liver and the kidneys.
- Hepatotoxicity:** having a destructive or harmful effect on liver cells.
- Histamine:** a naturally occurring substance found in all body tissues that has several functions including capillary dilatation, smooth muscle contraction, increased gastric secretion and acceleration of heart rate.
- Homeostasis:** the tendency to maintain a stable internal environment, such as constant body temperature or blood pressure.
- Homogeneous:** of the same quality or consistency throughout.
- Homogenous:** having a similar structure because of descent from a common ancestor.
- Hormone:** a chemical substance produced by an endocrine gland and circulated in the bloodstream that regulates the activity of an organ or tissues.
- Human chorionic gonadotrophin:** *see* HCG.
- Hyaluronidase:** an enzyme that catalyses the breakdown of hyaluronic acid.
- Hydrolysis:** the splitting of a compound by the addition of water.
- Hydrophilic:** a substance that has an affinity with water.
- Hydroxylation:** addition of a hydroxyl group.
- Hyperaemia:** an increase of blood in an area.
- Hyperaesthesia:** excessive sensitivity.
- Hyperbaric oxygen:** oxygen under greater than atmospheric pressure.
- Hyperbilirubinaemia:** excessive bilirubin in the blood, which may lead to jaundice.
- Hyperimmune:** having large quantities of specific antibodies in the serum.
- Hyperinsulinaemia:** excessively high blood insulin levels.
- Hyperkalaemia:** abnormally high potassium concentration in the blood.
- Hyperkeratosis:** thickening of the stratum corneum of the skin.
- Hypermagnesaemia:** abnormally high magnesium concentration in the blood.
- Hypernatraemia:** abnormally high sodium concentration in the blood.
- Hyperpigmentation:** excessive pigmentation of the skin.
- Hypertension:** a higher than normal arterial blood pressure.
- Hyperthermia:** abnormally raised core body temperature (to above 37.2°).
- Hyperventilation (hyperpnoea):** increased breathing that results in reduced carbon dioxide tension and alkalosis.
- Hypnotic:** a drug used to induce sleep.
- Hypocalcaemia:** low blood calcium concentration.
- Hypoglycaemia:** decreased concentration of glucose in the blood that may produce symptoms of anxiety, cold sweat, hypothermia and delirium or coma (hypoglycaemic coma).
- Hypoglycaemic agent:** an agent that controls blood sugar levels and is used in the management of diabetes mellitus.
- Hypoglycaemic coma:** *see* Hypoglycaemia.
- Hypokalaemia:** low potassium concentration in the blood.
- Hyponatraemia:** low sodium concentration in the blood.
- Hypophosphataemia:** decreased amounts of phosphates in the blood; signs include haemolysis, weakness and convulsions.
- Hypotension:** abnormally low blood pressure.
- Hypothermia:** a below normal core body temperature (35° or lower).
- Hypotonia:** reduced tone of the skeletal muscles.
- Hypotonic:** displaying hypotonia; solution with a low osmotic pressure.
- Hypoventilation:** reduced breathing that results in increased carbon dioxide tension.
- Hypoxia:** low oxygen level in the tissues despite adequate perfusion by blood.
- Iatrogenic:** any adverse condition that is a result of treatment by a doctor.
- Idiosyncrasy:** an abnormal individual reaction to a drug or protein or other administered agent.
- IgE:** one of the immunoglobulins that act as antibodies.
- Iliac:** relating to the ilium, part of the hip bone.
- Immune response:** the response of the immune system to an antigenic stimulus.
- Immunogen:** a substance capable of inducing an immune response.
- Immunoglobulin:** one of the 5 classes of glycoproteins (IgA, IgD, IgE, IgG and IgM) that function as antibodies.
- Immunostimulant:** an agent capable of stimulating immune responses.
- Immunosuppressant:** an agent that can suppress immune responses, such as a corticosteroid or ciclosporin.
- Immunotoxic:** toxic to or toxicity involving the immune system.
- Immunotoxin:** a molecule formed by coupling a toxin to an antibody.
- Impotence:** failure to initiate an erection or to maintain an erection until ejaculation.
- In vitro:** in the test tube.
- In vivo:** in living tissue.
- Incontinence:** inability to control defaecation or urination.
- Induce (metabolism):** increase/enhance metabolism of a substance.
- Inferior vena cava:** the main trunk vein that supplies the lower limbs.
- Ingestion:** the taking in of food/medicines by mouth.
- Inhaler:** an apparatus for administering a vapour or volatilised medication by inhalation.
- Insomnia:** inability to sleep; abnormal wakefulness.
- Insulin-like growth factor I:** one of a group of polypeptide hormones believed to be responsible for many of the anabolic effects of growth hormone.
- Interferon- α :** one of a large family of glycoproteins that are produced by virus-infected cells and that confer protection on uninfected cells of the same species.
- Interleukin-2:** a glycoprotein that stimulates the proliferation of T lymphocytes and therefore amplifies the immune response to an antigen.
- International Normalised Ratio:** a standardised form of the prothrombin-time ratio that allows for accurate monitoring of patients taking anticoagulant therapy.
- Interstitial nephritis:** inflammation of the interstitial tissue of the kidney.
- Intoxication:** Poisoning.
- Intracellular:** within a cell.
- Intramuscular:** within a muscle.
- Intraperitoneal:** within the peritoneal cavity (abdominal and pelvic cavities).
- Intravascular:** within a blood vessel.
- Intravenous:** within a vein.
- Isoform:** proteins that have the same function and similar structure but are specific to different tissues.
- Jaundice:** a condition characterised by hyperbilirubinaemia. Mild forms are only detectable chemically; more severe forms present with yellow discoloration of sclerae, skin and mucous membranes that results from deposition of bile pigment.
- Jejunum:** the portion of the small intestine between the duodenum and the ileum.
- Keratin:** a protein that is one of the main constituents of skin, hair and nails.
- Keshan disease:** a fatal disease of the heart muscle caused by dietary deficiency of essential trace elements.

Ketosis: accumulation of ketone bodies in the bloodstream and body tissues due to incomplete metabolism of fatty acids.

Kidneys: the two organs in the lumbar region that filter the blood and excrete waste products in urine and regulate the concentrations of various ions in the extracellular fluid.

Kinin: any of a group of polypeptides found in plasma, such as bradykinin, that cause vasodilatation of most vessels but vasoconstriction of the pulmonary vessels and also alter vascular permeability.

Lacrimation: tear formation.

Lactic acidosis: a metabolic acidosis that occurs when cellular respiration is impaired (in conditions such as shock and septicemia) producing a build up of lactic acid in the blood.

Laryngeal: relating to the larynx (voice box).

Laryngitis: inflammation of the larynx (voice box).

Laxative: an agent that promotes bowel evacuation.

Leptomeningeal: relating to the leptomeninges (the membranes that cover the brain and spinal cord).

Leptomeningeal carcinoma: cancer of the meninges (the membranes covering the brain and spinal cord), specifically the pia mater and arachnoid membranes.

Leukocyte: a white blood cell; there are several different types that are classified into two large groups, granular leukocytes (basophils, eosinophils, and neutrophils), and non-granular leukocytes (lymphocytes, and monocytes).

Leukopenia: reduction in the number of leukocytes in the blood below about 5000/mm³.

Lipid: a fat or fat-like substance that is characterised by being insoluble in water.

Lipid-lowering drug: a drug that reduces cholesterol and/or triglycerides in the blood and is used to treat hyperlipidaemias and to reduce cardiovascular risk.

Lipophilic: having an affinity for fat.

Loading dose: a large initial dose that is sometimes given so that therapeutic steady-state plasma concentrations are reached more quickly.

Local anaesthetic: an anaesthetic that produces reversible loss of function or sensation near to their site of application or injection by diminishing nerve impulse conduction.

Locus: in anatomy, a general term for a site in the body; in genetics, the position of a gene on a chromosome.

Lyme disease: an infectious disease, caused by *Borrelia burgdorferi* and transmitted largely by *Ixodes* ticks, that is a multi-system disease affecting the skin in the initial stages (erythema migrans), followed by variable effects on the nervous system, heart and joints.

Lymphatic: pertaining to lymph or a lymph vessel; by extension, the term is used alone to designate a lymphatic vessel or, in the plural, to designate the lymphatic system.

Lymphocyte: a type of white blood cell; there are two types, B lymphocytes that provide humoral immunity, and T lymphocytes that are responsible for cellular immunity.

Lymphocytosis: an increase in normal lymphocytes in the blood.

Lysozyme: an enzyme found in saliva and tears that acts as an antiseptic.

Macrocyte: an abnormally large red blood cell.

Malaise: a vague feeling of illness and discomfort.

Malate dehydrogenase: an enzyme found in the mitochondria and cytosol that catalyses the oxidation of L-malate to oxaloacetate.

Mania: undue elation with hyperexcitability and hyperactivity that occurs usually as a phase of bipolar disorder (manic depression).

Manic-depressive disorder: see Bipolar disorder.

Meconium: a dark greenish-black viscous substance that forms the first bowel movement in newborns.

Mees lines: white lines on the fingernails that can be a sign of poisoning with trace elements and arsenic.

Melanin: a black pigment found in skin, hair and the choroid of the eye.

Meningitis: inflammation of the meninges (the membranes surrounding the spinal cord and brain) usually caused by either bacterial or viral infection.

Mercapturic acid: a cysteine conjugate excreted in the urine that is the end-product of metabolism of a glutathione conjugate.

Metabolic acidosis: disturbance of the acid-base balance due to loss of base or accumulation of (non-carbonic) acid.

Metabolism: the chemical processes that occur in the maintenance of living tissues i. e. synthesis of new tissue (anabolism) and breakdown of old tissue (catabolism); also used to describe the chemical transformation undergone by drugs in the body (biotransformation).

Metabolism inducer: a substance that can enhance the rate of metabolism by increasing the numbers of metabolising enzymes.

Metabolite: any product of metabolism.

Metallothionein: a protein that is involved in the transport of metals, such as zinc, within the body.

Methaemoglobin: a brown pigment that is a form of haemoglobin (but which is unable to transport oxygen) in which the haem portion is oxidised from the ferrous to ferric state.

Methaemoglobinaemia: the presence of methaemoglobin in the blood; symptoms depend on the amount of methaemoglobin present and can range from breathlessness on exertion through to cyanosis, fatigue, nausea and vomiting, and drowsiness which can progress to stupor and coma.

Methylation: the addition of a methyl group to a compound.

Methyltransferase: an enzyme that catalyses the transfer of a methyl group from one compound to another.

Microflora: micro-organisms present in or characteristic of a specific location.

Microsomal enzyme: a general term used for the enzymes found in the smooth endoplasmic reticulum of cells that are responsible for the metabolism of foreign compounds, the major one being the cytochrome P450 system.

Minor tranquilliser: the old term for an anxiolytic sedative, such as diazepam, used for treating anxiety disorders.

Miosis: contraction of the pupils.

Mixed-function oxidase system: cytochrome P450-dependent oxidation reactions.

Monoamine oxidase inhibitor: a drug used to treat depression that inhibits monoamine oxidase (the enzyme responsible for the metabolism of several biogenic amines).

Motility: capable of spontaneous movement.

Motor: a muscle or nerve that produces movement.

Motor paralysis: paralysis of voluntary muscles.

Mucin: a mixture of glycoproteins that are secreted by many cells and are the main constituent of mucus.

Mucosa: a mucous membrane.

Mucous membrane: a membrane or lining that contains glands that secrete mucus.

Munchausens syndrome: a condition in which the patient repeatedly presents with an apparent acute physical illness and gives a false history.

Mutagen: a substance that causes changes in DNA.

Mutation: a permanent transmissible change in genetic material.

Mycotoxin: a fungal toxin.

Mydriasis: dilatation of the pupil of the eye.

Myocardial infarction: necrosis of heart muscle as a result of interruption of the blood supply to the area usually due to thrombosis at the site of a ruptured atheromatous plaque.

Myoglobinuria: the presence of myoglobin (the oxygen-transporting muscle protein) in the urine.

N-acetyltransferase: an enzyme that catalyses the transfer of an acetyl group, often acetyl coenzyme A, to another compound.

NAD: nicotinamide adenine dinucleotide and its reduced and oxidised forms are used as co-factors in many metabolic drug reactions.

NAD+: see NAD.

NADH: see NAD.

NADP: nicotine adenine dinucleotide phosphate is used as a cofactor in many metabolic drug reactions.

Narcolepsy: repetitive, uncontrollable episodes of sleep occurring in the daytime.

Narcotic: an agent that produces deep sleep, applied especially to the opioids.

Nasal septum: the partition between the nasal cavities.

Nausea: a feeling of sickness.

N-dealkylation: removal of an alkyl group from a compound where the alkyl group is attached to a nitrogen atom.

Necropsy: examination of a body after death.

Necrosis: localised death of tissue.

Neonatal: the first 4 weeks after birth.

Neonate: newborn infant up to 4 weeks old.

Neoplastic disease: generally used to refer to malignant neoplasms (cancers).

Nephrotoxicity: toxicity to kidney cells.

Neuroleptic: a drug that acts on the nervous system and is used in the treatment of psychoses (antipsychotic).

Neurological: relating to the nervous system.

Neuromuscular blocking drug: a drug that affects transmission at the neuromuscular junction and is used to produce muscle relaxation in anaesthesia.

Neuromuscular junction: the junction between the skeletal muscle fibre and the nerve that innervates it.

Neuropathy: damage to the peripheral nervous system.

Neurotoxic: toxic to the nervous system.

Neurotoxin: a toxin that is poisonous or destructive to nervous tissue.

Neurotransmitter: an endogenous substance involved in the transmission of nerve impulses, such as adrenaline.

Non-compliance: failure of the patient to comply with the dosage instructions for his/her medication.

N-oxidation: formation of an *N*-oxide.

NSAID: a non-steroidal anti-inflammatory drug.

Nystagmus: repetitive involuntary and jerky movement of the eyeball.

Organophosphorous insecticide: an insecticidal compound that contains phosphorus bound to an organic compound.

Ocular: relating to the eye.

O-dealkylation: metabolism of an aromatic alkyl ether to give a phenol and corresponding aldehyde.

Oedema: the presence of abnormally large amounts of fluid in the tissues of the body.

Oesophagus: the tube that extends from the pharynx to the stomach.

Oestrogens: a steroidal hormone that controls the development and maintenance of the female sex organs, secondary sex characteristics, and mammary glands as well as certain functions of the uterus.

Olfactory nerve: the nerve supplying the nose.

Opiate: an agent derived from opium.

Opioid: a narcotic with the same properties as an opiate but that is not derived from opium.

Opisthotonus: a spasm with extreme extension of the body with the head and the heels being bent backwards and the body bowed forwards.

Optic neuritis: inflammation of the optic nerve.

Oral adsorbent: a substance, such as activated charcoal, that is given by mouth to bind poisons in the gastrointestinal tract thereby reducing their absorption.

Oral contraceptive: an oestrogen and progestogen or progestogen-only preparation that is taken by mouth for contraception.

Organic aciduria: excessive excretion of one or more organic acids in the urine.

Osteoporosis: loss of bone density.

Ototoxicity: causing damage to the ear.

Oxyhaemoglobin: oxygenated haemoglobin.

P450 enzymes: see Cytochrome P450.

Paediatric: relating to paediatrics; the branch of medicine that deals with the child.

Pancytopenia: reduced amounts of platelets, and red and white cells in the blood.

Papillary necrosis (renal): death of the tissue that forms the papillae in the medulla of the kidneys.

Papule: a small circumscribed elevation of the skin.

Paraesthesia: an abnormal touch sensation (often without any external stimulus), such as tingling, burning or pricking.

Paralysis: loss or impairment of motor function that may be due to damage to the nerves or muscular mechanisms.

Paranoia: behaviour characterised by delusions of persecution or of grandeur, or a combination of the two.

Parasympathetic system: a part of the autonomic nervous system.

Parent drug: the administered drug that undergoes metabolism to form an active metabolite.

Parenteral: administration of a drug (or exposure to a substance) by a route other than the gastro-intestinal tract.

Parkinsons disease: a slowly progressive neurodegenerative disease with reduced brain dopamine activity characterised by tremor, impaired voluntary movement, and loss of postural reflexes.

Parotid gland: the salivary gland.

Pathogenesis: the development and origin of disease.

Pathognomonic: a sign or a symptom that is distinctive to a particular disease and therefore allows a diagnosis to be made.

Peptide: a molecule made up of 2 or more amino acids.

Pericardial: relating to the pericardium, the membranous sac that surrounds the heart.

Perimortem: the time immediately before and after death.

Peripheral blood: blood in the systemic circulation.

Peripheral neuritis: inflammation of a peripheral nerve.

Peristalsis: waves of contraction and relaxation that pass along the intestines and that move the contents along.

Peritoneal dialysis: removal of waste products from the blood by irrigation of the peritoneal cavity with a dialysis solution.

Perspiration: see Sweating.

P-glycoprotein: a cell surface protein found in many cells, including tumour cells where it aids transport of anti-cancer drugs out of the tumour cell and is therefore responsible for drug resistance.

Pharmacodynamics: the study of the effects of drugs and the mechanisms of their actions and the correlation of these with their chemical structure.

Pharmacogenetics: the study of the relationship between genetic factors and the effects produced by drugs (often refers to side effects produced by drugs).

Pharmacokinetics: the study of the absorption, distribution and clearance (metabolism and excretion) of drugs with respect to time.

Pharmacological: relating to the properties and reactions of drugs.

Pharyngitis: inflammation of the throat.

Phase I metabolism: alteration of the foreign molecule (drug) so that a functional group is added or uncovered that can then undergo conjugation in a phase II metabolic reaction.

Phase II metabolism: a conjugation reaction (addition of another moiety) that generally increases the water solubility of the product enabling its excretion in the bile or urine.

Phenothiazine: any of a group of antipsychotic agents derived from the phenothiazine structure.

Phenotype: the physical, biochemical and physiological make-up of an individual (includes genetically and environmentally determined traits).

Phemelanin: a sulfur-containing type of melanin found in red hair.

Phosphodiesterase: an enzyme that catalyses the hydrolysis of one of the ester linkages in a phosphodiester compound.

Phospholipase: an enzyme that catalyses the hydrolysis of an ester bond in a phospholipid.

Phospholipase A₂: an esterase that catalyses the hydrolysis of a membrane phospholipid.

Piloerection: erection of the hair.

Pink disease: a disease of early childhood, usually caused by mercury poisoning, and characterised by pink, swollen fingers and toes and other symptoms that include skin rashes, listlessness, irritability, failure to thrive and photophobia.

Pituitary gland: a gland located at the base of the brain attached to the hypothalamus.

Pituitary hormone: one of the hormones secreted by the pituitary gland, such as gonadotrophin or growth hormone.

Placental transfer: transfer of a substance from the mothers blood to the fetus blood by passage through the placenta.

Plasma: the fluid fraction of blood; plasma is to be distinguished from serum (see below).

Plasma esterase: an enzyme that acts on ester bonds to produce an alcohol and an acid.

Pleural: relating to the pleura, the serous membrane that covers the surface of the lungs.

Polymerase: an enzyme that catalyses polymerisation, especially of nucleotides to polynucleotides.

Polymorphic: occurring in several or many forms.

Polypeptide: a chain of amino acids.

Polyuria: excretion of an excessive volume of urine, as in diabetes mellitus.

Portal vein: the vein that supplies blood to the liver.

Positional nystagmus: nystagmus that occurs or is altered depending on the position of the head.

Postmortem: after death.

Precursor: in biological processes, a substance that undergoes transformation/ degradation to form a more active compound.

Presynaptic: situated just before the synapse (the join of 2 adjacent neurones).

Pre-systemic: occurring before the drug is in the systemic circulation.

Procollagen: a precursor of collagen, the protein that forms connective tissue.

Prodrug: an inactive drug that, after administration, is metabolised to produce the active pharmacological agent.

Prognosis: a forecast of the probable outcome of a disease.

Prophylaxis: an intervention that is aimed at the prevention of a disease.

Protease: an enzyme that catalyses the splitting of internal peptide bonds in a polypeptide or protein.

Protein: a nitrogenous organic compound that is composed of amino acids.

Protein binding: Non-covalent binding of a drug to a plasma protein (usually albumin).

Protein phosphatase: a hydrolase enzyme that catalyses the cleavage of phosphoryl groups from phosphoproteins.

Proteolysis: the breaking down of proteins into smaller polypeptides.

Proteolytic enzyme: an enzyme that catalyses the breakdown of proteins.

Proteomics: the study of the proteome (the complete set of proteins produced from the information encoded in a genome) under various conditions, as a means of understanding biological processes.

Prothrombin time: the time taken for a clot to form in plasma on the addition of thromboplastin and calcium.

Protozoal: relating to the Protozoa (unicellular organisms).

Provocation test: the administration of a chemical or antigen in order to assess for a response.

Proximal renal tubule: part of the nephron in the kidney.

Pruritus: Itching.

Pseudocholinesterase: a plasma enzyme that is responsible for the metabolism and inactivation of succinylcholine.

Pseudohallucination: a hallucination that the subject knows is unreal and is generated within the mind.

Psychic: relating to the mind.

Psychoactive drug: a drug that has an effect on mental state (also called a psychotropic drug).

Psychological dependence: a substance dependence in which the drug is used to obtain relief from tension or emotional discomfort rather than being associated with tolerance or withdrawal.

Psychomotor: relating to motor effects of cerebral or psychic activity.

Psychomotor skills: the motor effects of cerebral or psychic activity.

Psychosis: a severe psychiatric disorder in which there is disordered thinking and loss of contact with reality due to delusions and/or hallucinations; there may also be mood and behavioural disturbances.

Psychotropic drug: *see* Psychoactive drug.

Ptoisis: drooping of the upper eyelid.

Pulmonary: relating to the lungs.

Pulmonary fibrosis: chronic inflammation and progressive fibrosis of the lungs.

Pulmonary oedema: accumulation of extravascular fluid in the lungs.

Pulse: the expansion of the arteries that is transmitted by the contraction of the left ventricle that is usually palpated at the wrist.

Pupillary dilation: dilation of the pupils of the eye.

Purgative: *see* Laxative.

Putrefaction: the process of decomposition or rotting.

Pyrogenic: causing fever.

QT-time: a measure on the electrocardiogram recording between the Q and the T points of the action potential.

Receptor: a molecular structure within a cell or on its surface that binds a specific substance or drug to elicit a specific physiologic effect.

Recombinant EPO: *see* Erythropoietin.

Recombinant growth hormone: *see* Growth hormone.

Rectal: relating to the rectum, the lower part of the large intestine that ends in the anal canal.

Red blood cells: *see* Erythrocytes.

Red cells: *see* Erythrocytes.

Reduced haemoglobin (deoxyhaemoglobin or deoxygenated haemoglobin): haemoglobin that is formed when oxyhaemoglobin releases its oxygen.

Reflux (gastric): a backward flow; usually refers to gastric reflux where the stomach contents reflux back into the oesophagus.

Regime: a regulated programme of an activity, such as exercise, diet or medication.

Regurgitation: *see* Vomiting.

Renal carcinoma: cancer of the kidney.

Renal clearance: clearance of a drug/metabolite from the blood by excretion by the kidney.

Renal dysfunction: *see* Renal impairment.

Renal failure: the progressive loss of renal function so that waste products and metabolites accumulate in the blood; it usually refers to a glomerular filtration rate of less than 10 mL/min.

Renal impairment: a reduced renal function where glomerular filtration rate is between 10 and 60 mL/min.

Renal tubule: part of the nephron in the kidney.

Respiration: the act of breathing.

Respiratory alkalosis: an increase in tissue pH that is a result of excess loss of carbon dioxide from the body, usually caused by hyperventilation.

Respiratory arrest: when breathing stops.

Respiratory failure: a condition resulting from respiratory insufficiency, in which there is persistent abnormally low arterial oxygen tension or abnormally high carbon dioxide tension.

Reticulocyte: an immature red blood cell.

Retroperitoneal: behind the peritoneum (the membrane that lines the abdominal and pelvic cavities).

Rhabdomyolysis: disintegration of muscle, associated with excretion of myoglobin in the urine.

Rhodanese: an enzyme involved in the metabolism of cyanide.

RNA: ribonucleic acid, the genetic material in RNA viruses.

Salicylate: a compound derived from salicylic acid; it is an inhibitor of prostaglandin synthesis and has analgesic, antipyretic and anti-inflammatory effects.

Saliva: the clear, alkaline secretion from the salivary glands.

Salivation: the secretion of saliva.

Sebaceous glands: the glands of the skin that secrete sebum.

Sebum: the oily secretion of the sebaceous glands.

Sedative: an agent that reduces functional activity (may also be called a tranquiliser).

Seizure: a single episode of epilepsy.

Sensory nerve: a nerve that conducts impulses from a sense organ back to the spinal cord or brain.

Serotonin: a monoamine found in the brain, blood platelets and gastro-intestinal tract that has various functions including involvement in central nervous system transmission, vascular spasm and gastro-intestinal motility.

Serous fluid: pertaining to or resembling serum.

Serum: the cell-free and fibrinogen-free fluid that remains once plasma or blood has clotted.

Shock: failure of the circulatory system to maintain adequate perfusion of vital organs.

Skeletal muscle: striated muscle that is attached to bone.

Small intestine: the proximal part of the intestine, comprising the duodenum, jejunum and ileum.

Sodium channel: a protein channel selective for the passage of sodium ions.

Somatic nerve: a nerve that supplies skeletal muscle.

Spastic paresis: a form of paralysis with associated muscle spasms and hypertonia.

Spleen: a large vascular organ in the upper part of the abdominal cavity that produces lymphocytes and plasma cells and also breaks down red blood cells.

SSRI: selective serotonin re-uptake inhibitor, such as fluoxetine, that is used for the management of depression.

Steady-state concentration: the plasma-drug concentration that is achieved with chronic dosing.

Steroid: a term used to denote a naturally occurring lipid, related to cholesterol, that has a particular ring structure, such as the adrenocortical hormones, sex hormones, bile acids and sterols.

Sterol: a steroid, such as cholesterol or ergosterol, that has a ring structure with a long side-chain at position 17 and at least one alcoholic hydroxyl group, usually at position 3.

Stimulant drug: an agent or remedy that produces stimulation.

Striated muscle: a muscle that has the appearance of fine stripes, e.g. cardiac and voluntary muscle.

Stroke: A stroke, previously known medically as a cerebrovascular accident (CVA), is the rapidly developing loss of brain function(s) due to disturbance in the blood supply to the brain.

Stupor: a state of marked impairment of consciousness that only responds to vigorous stimulation.

Subclavian: below the clavicle (collar-bone).

Subcutaneous: underneath the skin.

Sublingual: underneath the tongue.

Sublingual glands: salivary glands underneath the tongue.

Submandibular glands: salivary glands underneath the jaw.

Substrate: a substance upon which an enzyme acts.

Sudoresis: *see* Sweating.

Sulphaemoglobin: (sulphaemoglobin, sulphmethaemoglobin) a sulfide oxidation product of haemoglobin that cannot transport oxygen or carbon dioxide and is formed in the body by certain drugs.

Sulfotransferase: an enzyme that catalyses the transfer of a sulfate group.

Sulfoxidation: the addition of an oxygen atom to the sulfur atom of an organic compound to form a sulfoxide.

Suppository: a solid dosage form, administered usually rectally or vaginally, in which the drug is dispersed in a base that is solid at room temperature but melts or dissolves at body temperature.

Surrogate: a substitute.

Sweat: the liquid secreted by the sweat glands.

Sweating: the secretion of sweat.

Sympathetic: a part of the autonomic nervous system.

Symptom: any subjective evidence of disease.

Synaesthesia: a sense impairment where stimulus of one part of the body may produce a sensation in a different part of the body or in a different sense, for example a sound produces a sensation of colour.

Synergism: when the effect produced by 2 substances together is greater than the additive effect of the 2 compounds.

Systemic circulation: the general circulation that carries oxygenated blood from the left side of the heart to the tissues of the body, and returns the venous blood to the heart.

Systemic lupus erythematosus: an auto-immune disease, more common in women, that is characterised by tissue damage involving the skin, joints, kidneys, central nervous system and other organs, with the most common symptom being arthralgia or arthritis.

Tachyarrhythmia: any disturbance of the heart rhythm in which the heart rate is abnormally increased.

Tachycardia: excessive rapidity in the action of the heart.

Telogen phase: the resting third phase of the hair growth cycle that follows catagen.

Teratogen: any agent or factor capable of disrupting fetal development and producing malformation.

Tetanus: uncontrolled muscle spasm that is caused by the neurotoxin produced by the bacillus *Clostridium tetani*.

Therapeutic index: the ratio of the median lethal dose to the median effective dose.

Therapeutic range: *see* Therapeutic window.

Therapeutic window: the range between the minimum and maximum doses of a drug.

Thoracic: relating to or affecting the thorax (chest).

Thrombocytopenic purpura: any form of purpura (spontaneous extravasation of blood from capillaries into the skin) in which the platelet count is decreased.

Thyroid: gland that sits on both sides of the windpipe and secretes thyroxine that controls the rate of metabolism.

Tinnitus: a sound in the ears such as buzzing, ringing, roaring or clicking.

Tissue plasminogen activator: an endogenous enzyme that converts plasminogen in blood clots to fibrinolysin that results in breakdown of the clot; several types of tissue plasminogen activator are available for clinical use for the treatment of thromboembolic disorders.

Tolerance: a decreasing response to a stimulus after prolonged exposure (*see also* Drug tolerance).

Torsade de pointes: a potentially lethal ventricular tachycardia with a characteristic ECG pattern.

Toxin: a poison.

Trachea: the windpipe that descends from the larynx to the bronchi.

Tranquilliser: a drug with a calming or soothing effect (usually refers to an anti-anxiety agent, also known as a minor tranquilliser).

Transferrin: a serum glycoprotein that binds and transports iron.

Transfusion: the introduction of blood (whole blood or blood components) directly into a blood vessel.

Transit time: a measure of the time required for faeces to pass through the colon.

Transplant: an organ or tissue that is removed from its site in the body and grafted into another site or into another individual.

Tremor: an involuntary trembling.

Tricyclic antidepressant: an antidepressant drug that possesses a three-ring molecular structure and that inhibits the neuronal re-uptake of noradrenaline in the central nervous system.

Trophic: relating to nutrition.

Trough concentration: the minimum plasma-drug concentration that occurs before administration of the following dose.

Trypsin: an enzyme present in pancreatic secretions that catalyses the breakdown of protein.

L-tryptophan: an amino acid that is an essential constituent of the diet.

Tuberculostatic drug: a drug, such as isoniazid or rifampicin, that is used in the treatment of tuberculosis.

Tubular necrosis (renal): severe damage or necrosis of the tubule cells of the kidney that causes acute renal failure.

Tyrosine hydroxylase: an enzyme found in the brain that activates molecular oxygen to catalyse the hydroxylation of tyrosine to dopa.

Uraemia: retention in the blood of urea, creatinine and other nitrogenous products of protein metabolism.

Urea: the end-product of protein metabolism that is excreted in the urine.

Urea nitrogen: the urea concentration of blood or serum expressed in terms of nitrogen content.

Uridine diphosphate glucuronosyltransferase: one of the enzymes involved in glucuronide formation.

Urinary retention: accumulation of urine within the bladder due to inability to urinate.

Urine: the fluid excreted by the kidneys.

Urticaria: a usually transient allergic skin reaction consisting of itchy, pinkish, raised wheals.

Vaccine: a suspension or extract of attenuated or killed micro-organisms used for the prevention or treatment of infectious diseases.

Vaginal: relating to the vagina.

Vasculopathy: any disorder of the blood vessels.

Vasodilator: causing dilation of the blood vessels.

Vasospasm: a spasm of blood vessels producing vasoconstriction.

Venepuncture: insertion of a needle into a vein.

Venous blood: blood obtained from a vein.

Vertical nystagmus: an up-and-down movement of the eyes.

Vesicle: a small bladder or sac containing fluid; a skin blister.

Visual acuity: sharpness of vision.

Vitamin: a substance that is found in many foods in small amounts and is necessary in trace amounts for the normal metabolic functioning of the body.

Vitreous humour: the transparent jelly-like substance that fills the cavity inside the eyeball between the lens and the retina.

Volume of distribution: the apparent volume of body fluids into which a drug is distributed.

Vomiting: the forcible expulsion of the stomach contents through the mouth.

Vomitus: matter that has been vomited.

Washout: irrigation or lavage of a body cavity (often the stomach).

Wheal: an itchy skin reaction, typical of urticaria, with smooth blister-type lesions that are redder or paler than the surrounding skin.

Whole blood: blood from which none of the elements have been removed.

Wilson disease: *see* Hepatolenticular degeneration.

Withdrawal symptoms: a substance-specific mental disorder that follows the cessation of use or reduction in intake of a psychoactive substance that had been regularly used to induce a state of intoxication.

Wolff-Parkinson-White syndrome: a disturbed heart rhythm where there is atrial fibrillation in association with pre-excitation.

Xanthine: a purine derivative, such as theophylline, used for its bronchodilator properties.

Xenobiotic: a chemical foreign to a given biological system.
